# Chapter 1

## Hardware Locality

**Portable abstraction of hierarchical architectures for high-performance computing**

### 1.1 Introduction

hwloc provides command line tools and a C API to obtain the hierarchical map of key computing elements, such as: NUMA memory nodes, shared caches, processor sockets, processor cores, and processing units (logical processors or "threads"). hwloc also gathers various attributes such as cache and memory information, and is portable across a variety of different operating systems and platforms.

hwloc primarily aims at helping high-performance computing (HPC) applications, but is also applicable to any project seeking to exploit code and/or data locality on modern computing platforms.

Note that the hwloc project represents the merger of the libtopology project from INRIA and the Portable Linux Processor Affinity (PLPA) sub-project from Open MPI. *Both of these prior projects are now deprecated.* The first hwloc release is essentially a "re-branding" of the libtopology code base, but with both a few genuinely new features and a few PLPA-like features added in. More new features and more PLPA-like features will be added to hwloc over time. See [Switching from PLPA to hwloc](#) for more details about converting your application from PLPA to hwloc.

hwloc supports the following operating systems:

- Linux (including old kernels not having sysfs topology information, with knowledge of cpusets, offline cpus, ScaleMP vSMP, and Kerrighed support)
- Solaris

- AIX
- Darwin / OS X
- FreeBSD and its variants, such as kFreeBSD/GNU
- OSF/1 (a.k.a., Tru64)
- HP-UX
- Microsoft Windows

hwloc only reports the number of processors on unsupported operating systems; no topology information is available.

For development and debugging purposes, hwloc also offers the ability to work on "fake" topologies:

- Symmetrical tree of resources generated from a list of level arities
- Remote machine simulation through the gathering of Linux sysfs topology files

hwloc can display the topology in a human-readable format, either in graphical mode (X11), or by exporting in one of several different formats, including: plain text, PDF, PNG, and FIG (see [CLI Examples](#) below). Note that some of the export formats require additional support libraries.

hwloc offers a programming interface for manipulating topologies and objects. It also brings a powerful CPU bitmap API that is used to describe topology objects location on physical/logical processors. See the [Programming Interface](#) below. It may also be used to bind applications onto certain cores or memory nodes. Several utility programs are also provided to ease command-line manipulation of topology objects, binding of processes, and so on.

## 1.2 Installation

hwloc (<http://www.open-mpi.org/projects/hwloc/>) is available under the BSD license. It is hosted as a sub-project of the overall Open MPI project (<http://www.open-mpi.org/>). Note that hwloc does not require any functionality from Open MPI -- it is a wholly separate (and much smaller!) project and code base. It just happens to be hosted as part of the overall Open MPI project.

Nightly development snapshots are available on the web site. Additionally, the code can be directly checked out of Subversion:

```
shell$ svn checkout http://svn.open-mpi.org/svn/hwloc/trunk hwloc-trunk
shell$ cd hwloc-trunk
shell$ ./autogen.sh
```

Note that GNU Autoconf >=2.63, Automake >=1.10 and Libtool >=2.2.6 are required when building from a Subversion checkout.

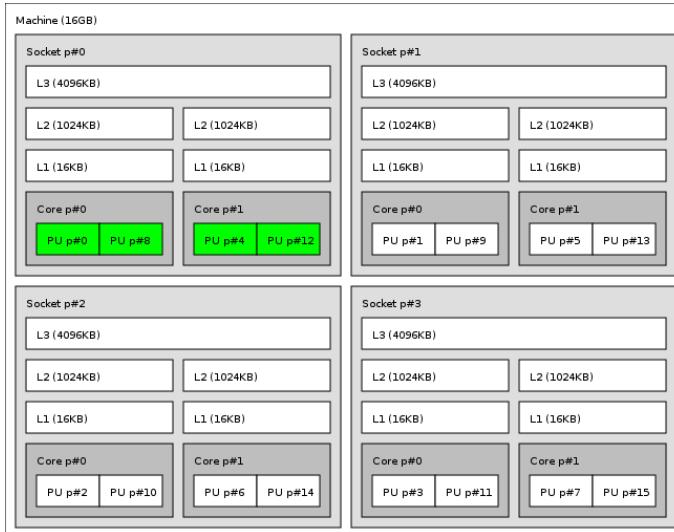

Installation by itself is the fairly common GNU-based process:

```
shell$ ./configure --prefix=...
shell$ make
shell$ make install
```

The hwloc command-line tool "lstopo" produces human-readable topology maps, as mentioned above. It can also export maps to the "fig" file format. Support for PDF, Postscript, and PNG exporting is provided if the "Cairo" development package can be found when hwloc is configured and build. Similarly, lstopo's XML support requires the libxml2 development package.

## 1.3 CLI Examples

On a 4-socket 2-core machine with hyperthreading, the `lstopo` tool may show the following graphical output:

Here's the equivalent output in textual form:

```
Machine (16GB)
Socket #0 + L3 #0 (4096KB)
L2 #0 (1024KB) + L1 #0 (16KB) + Core #0
PU #0 (phys=0)
PU #1 (phys=8)
L2 #1 (1024KB) + L1 #1 (16KB) + Core #1
PU #2 (phys=4)
```

```

    PU #3 (phys=12)
    Socket #1 + L3 #1 (4096KB)
        L2 #2 (1024KB) + L1 #2 (16KB) + Core #2
            PU #4 (phys=1)
            PU #5 (phys=9)
        L2 #3 (1024KB) + L1 #3 (16KB) + Core #3
            PU #6 (phys=5)
            PU #7 (phys=13)
    Socket #2 + L3 #2 (4096KB)
        L2 #4 (1024KB) + L1 #4 (16KB) + Core #4
            PU #8 (phys=2)
            PU #9 (phys=10)
        L2 #5 (1024KB) + L1 #5 (16KB) + Core #5
            PU #10 (phys=6)
            PU #11 (phys=14)
    Socket #3 + L3 #3 (4096KB)
        L2 #6 (1024KB) + L1 #6 (16KB) + Core #6
            PU #12 (phys=3)
            PU #13 (phys=11)
        L2 #7 (1024KB) + L1 #7 (16KB) + Core #7
            PU #14 (phys=7)
            PU #15 (phys=15)

```

Finally, here's the equivalent output in XML. Long lines were artificially broken for document clarity (in the real output, each XML tag is on a single line), and only socket #0 is shown for brevity:

```

<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE topology SYSTEM "hwloc.dtd">
<topology>
    <object type="Machine" os_level="-1" os_index="0" cpuset="0x0000ffff"
        complete_cpuset="0x0000ffff" online_cpuset="0x0000ffff"
        allowed_cpuset="0x0000ffff"
        dmi_board_vendor="Dell Computer Corporation" dmi_board_name="ORD318"
        local_memory="16648183808">

            <object type="PU" os_level="-1" os_index="12" cpuset="0x00001000"
                complete_cpuset="0x00001000" online_cpuset="0x00001000"
                allowed_cpuset="0x00001000"/>
        </object>
        </object>
    </object>
</object>
<!-- ...other sockets listed here ... -->
</object>
</topology>

```

On a 4-socket 2-core Opteron NUMA machine, the `lstopo` tool may show the following graphical output:

Here's the equivalent output in textual form:

```

Machine (64GB)
NUMANode #0 (phys=0 8190MB) + Socket #0
L2 #0 (1024KB) + L1 #0 (64KB) + Core #0 + PU #0 (phys=0)

```

```

L2 #1 (1024KB) + L1 #1 (64KB) + Core #1 + PU #1 (phys=1)
NUMANode #1 (phys=1 8192MB) + Socket #1
L2 #2 (1024KB) + L1 #2 (64KB) + Core #2 + PU #2 (phys=2)
L2 #3 (1024KB) + L1 #3 (64KB) + Core #3 + PU #3 (phys=3)
NUMANode #2 (phys=2 8192MB) + Socket #2
L2 #4 (1024KB) + L1 #4 (64KB) + Core #4 + PU #4 (phys=4)
L2 #5 (1024KB) + L1 #5 (64KB) + Core #5 + PU #5 (phys=5)
NUMANode #3 (phys=3 8192MB) + Socket #3
L2 #6 (1024KB) + L1 #6 (64KB) + Core #6 + PU #6 (phys=6)
L2 #7 (1024KB) + L1 #7 (64KB) + Core #7 + PU #7 (phys=7)
NUMANode #4 (phys=4 8192MB) + Socket #4
L2 #8 (1024KB) + L1 #8 (64KB) + Core #8 + PU #8 (phys=8)
L2 #9 (1024KB) + L1 #9 (64KB) + Core #9 + PU #9 (phys=9)
NUMANode #5 (phys=5 8192MB) + Socket #5
L2 #10 (1024KB) + L1 #10 (64KB) + Core #10 + PU #10 (phys=10)
L2 #11 (1024KB) + L1 #11 (64KB) + Core #11 + PU #11 (phys=11)
NUMANode #6 (phys=6 8192MB) + Socket #6
L2 #12 (1024KB) + L1 #12 (64KB) + Core #12 + PU #12 (phys=12)
L2 #13 (1024KB) + L1 #13 (64KB) + Core #13 + PU #13 (phys=13)
NUMANode #7 (phys=7 8192MB) + Socket #7
L2 #14 (1024KB) + L1 #14 (64KB) + Core #14 + PU #14 (phys=14)
L2 #15 (1024KB) + L1 #15 (64KB) + Core #15 + PU #15 (phys=15)

```

And here's the equivalent output in XML. Similar to above, line breaks were added and only PU#0 is shown for brevity:

```

<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE topology SYSTEM "hwloc.dtd">
<topology>
<object type="Machine" os_level="-1" os_index="0" cpuset="0x000000ff"

</object>
</object>
</object>
<!-- ...more objects listed here ... -->
</topology>

```

On a 2-socket quad-core Xeon (pre-Nehalem, with 2 dual-core dies into each socket):

Here's the same output in textual form:

```

Machine (16GB)
Socket #0
L2 #0 (4096KB)
L1 #0 (32KB) + Core #0 + PU #0 (phys=0)
L1 #1 (32KB) + Core #1 + PU #1 (phys=4)
L2 #1 (4096KB)
L1 #2 (32KB) + Core #2 + PU #2 (phys=2)
L1 #3 (32KB) + Core #3 + PU #3 (phys=6)
Socket #1
L2 #2 (4096KB)
L1 #4 (32KB) + Core #4 + PU #4 (phys=1)
L1 #5 (32KB) + Core #5 + PU #5 (phys=5)

```

```
L2 #3 (4096KB)
  L1 #6 (32KB) + Core #6 + PU #6 (phys=3)
  L1 #7 (32KB) + Core #7 + PU #7 (phys=7)
```

And the same output in XML (line breaks added, only PU#0 shown):

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE topology SYSTEM "hwloc.dtd">
<topology>
  <object type="Machine" os_level="-1" os_index="0" cpuset="0x000000ff"

```

## 1.4 Programming Interface

The basic interface is available in [hwloc.h](#). It essentially offers low-level routines for advanced programmers that want to manually manipulate objects and follow links be-

tween them. Documentation for everything in `hwloc.h` are provided later in this document. Developers should also look at `hwloc/helper.h` (and also in this document, which provides good higher-level topology traversal examples).

To precisely define the vocabulary used by hwloc, a [Terms and Definitions](#) section is available and should probably be read first.

Each hwloc object contains a cpuset describing the list of processing units that it contains. These cpusets may be used for [Binding](#). hwloc offers an extensive cpuset manipulation interface in `hwloc/cpuset.h`.

Moreover, hwloc also comes with additional helpers for interoperability with several commonly used environments. See the [Interoperability with other software](#) section for details.

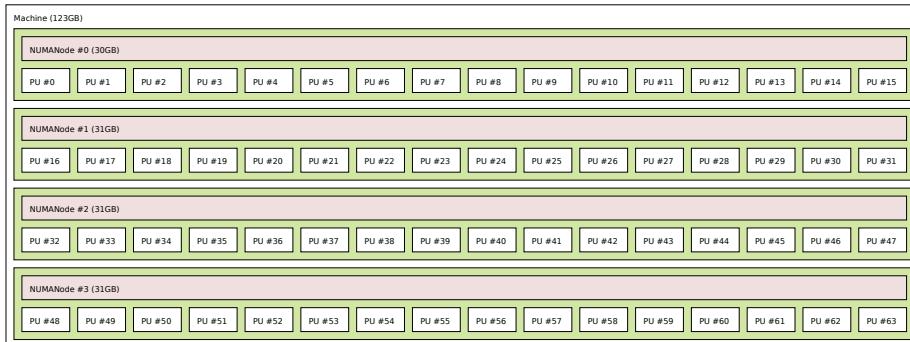

The complete API documentation is available in a full set of HTML pages, man pages, and self-contained PDF files (formatted for both US letter and A4 formats) in the source tarball in `doc/doxygen-doc/`.

**NOTE:** If you are building the documentation from a Subversion checkout, you will need to have Doxygen and pdflatex installed -- the documentation will be built during the normal "make" process. The documentation is installed during "make install" to `$prefix/share/doc/hwloc/` and your systems default man page tree (under `$prefix`, of course).

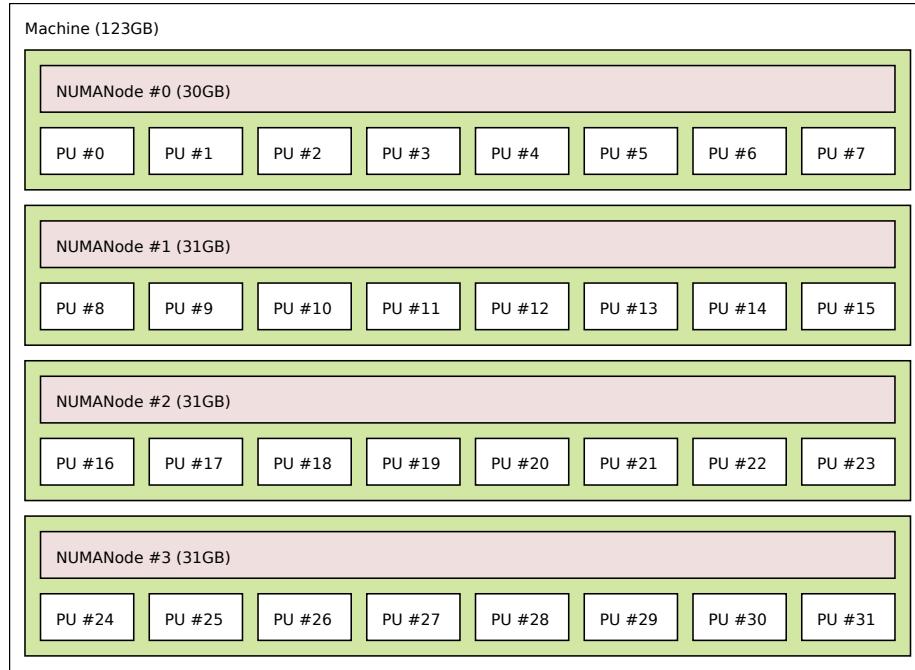

### 1.4.1 Portability (especially when using the API or XML)

As shown in [CLI Examples](#), hwloc can obtain information on a wide variety of hardware topologies. However, some platforms and/or operating system versions will only report a subset of this information. For example, on an PPC64-based system with 32 cores (each with 2 hardware threads) running a default 2.6.18-based kernel from RHEL 5.4, hwloc is only able to glean information about NUMA nodes and processor units (PUs). No information about caches, sockets, or cores is available.

Here's the graphical output from lstopo on this platform when Simultaneous Multi-Threading (SMT) is enabled:

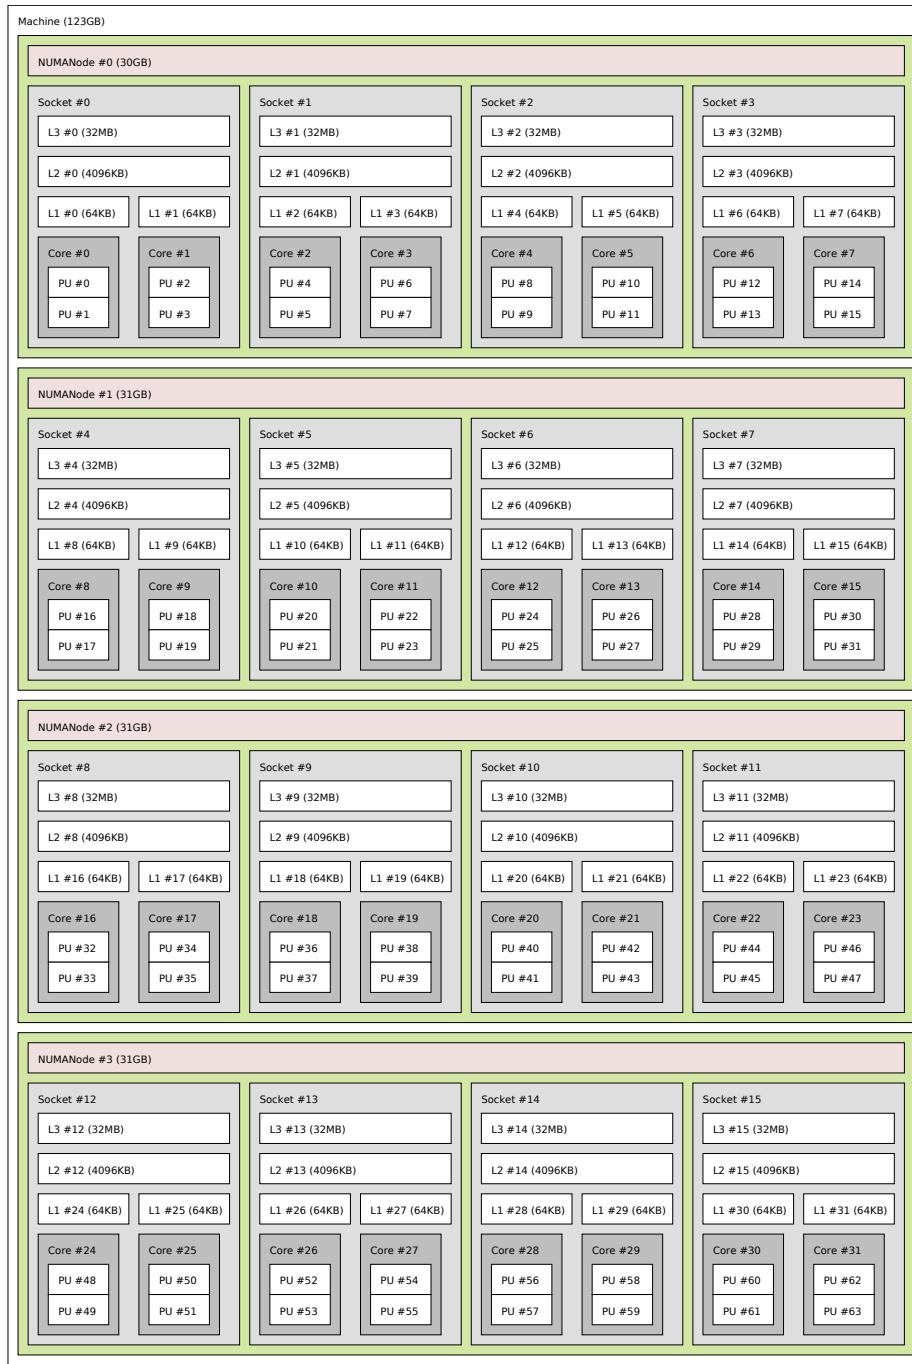

And here's the graphical output from lstopo on this platform when SMT is disabled:

Notice that hwloc only sees half the PUs when SMT is disabled. PU#15, for example, seems to change location from NUMA node #0 to #1. In reality, no PUs "moved" -- they were simply re-numbered when hwloc only saw half as many. Hence, PU#15 in the SMT-disabled picture probably corresponds to PU#30 in the SMT-enabled picture.

This same "PUs have disappeared" effect can be seen on other platforms -- even platforms / OSs that provide much more information than the above PPC64 system. This is an unfortunate side-effect of how operating systems report information to hwloc.

Note that upgrading the Linux kernel on the same PPC64 system mentioned above to 2.6.34, hwloc is able to discover all the topology information. The following picture shows the entire topology layout when SMT is enabled:

Developers using the hwloc API or XML output for portable applications should there-

fore be extremely careful to not make any assumptions about the structure of data that is returned. For example, per the above reported PPC topology, it is not safe to assume that PUs will always be descendants of cores.

Additionally, future hardware may insert new topology elements that are not available in this version of hwloc. Long-lived applications that are meant to span multiple different hardware platforms should also be careful about making structure assumptions. For example, there may someday be an element "lower" than a PU, or perhaps a new element may exist between a core and a PU.

### **1.4.2 API Example**

The following small C example (named "hwloc-hello.c") prints the topology of the machine and bring the process to the first logical processor of the second core of the machine.

```
/* Example hwloc API program.
 *
 * Copyright © 2009 INRIA, Université Bordeaux 1
 * Copyright © 2009-2010 Cisco Systems, Inc. All rights reserved.
 *
 * hwloc-hello.c
 */

#include <hwloc.h>

static void print_children(hwloc_topology_t topology, hwloc_obj_t obj,
                           int depth)
{
    char string[128];
    unsigned i;

    hwloc_obj_snprintf(string, sizeof(string), topology, obj, "#", 0);
    printf("%*s%s\n", 2*depth, "", string);
    for (i = 0; i < obj->arity; i++) {
        print_children(topology, obj->children[i], depth + 1);
    }
}

int main(void)
{
    int depth;
    unsigned i;
    unsigned long size;
    int levels;
    char string[128];
    int topodepth;
    hwloc_topology_t topology;
    hwloc_cpuset_t cpuset;
    hwloc_obj_t obj;

    /* Allocate and initialize topology object. */
    hwloc_topology_init(&topology);
```

```
/* ... Optionally, put detection configuration here to ignore
   some objects types, define a synthetic topology, etc....
```

The default is to detect all the objects of the machine that the caller is allowed to access. See Configure Topology Detection. \*/

```
/* Perform the topology detection. */
hwloc_topology_load(topology);

/* Optionally, get some additional topology information
   in case we need the topology depth later. */
topodepth = hwloc_topology_get_depth(topology);

/*****************
 * First example:
 * Walk the topology with an array style, from level 0 (always
 * the system level) to the lowest level (always the proc level).
*****************/
for (depth = 0; depth < topodepth; depth++) {
    printf("*** Objects at level %d\n", depth);
    for (i = 0; i < hwloc_get_nbobjs_by_depth(topology, depth);
         i++) {
        hwloc_obj_snprintf(string, sizeof(string), topology,
                           hwloc_get_obj_by_depth(topology, depth, i),
                           "#", 0);
        printf("Index %u: %s\n", i, string);
    }
}

/*****************
 * Second example:
 * Walk the topology with a tree style.
*****************/
printf("*** Printing overall tree\n");
print_children(topology, hwloc_get_root_obj(topology), 0);

/*****************
 * Third example:
 * Print the number of sockets.
*****************/
depth = hwloc_get_type_depth(topology, HWLOC_OBJ_SOCKET);
if (depth == HWLOC_TYPE_DEPTH_UNKNOWN) {
    printf("*** The number of sockets is unknown\n");
} else {
    printf("*** %u socket(s)\n",
           hwloc_get_nbobjs_by_depth(topology, depth));
}

/*****************
 * Fourth example:
 * Compute the amount of cache that the first logical processor
 * has above it.
*****************/
levels = 0;
size = 0;
```

```

for (obj = hwloc_get_obj_by_type(topology, HWLOC_OBJ_PU, 0);
     obj;
     obj = obj->parent)
    if (obj->type == HWLOC_OBJ_CACHE) {
        levels++;
        size += obj->attr->cache.size;
    }
printf("*** Logical processor 0 has %d caches totaling %luKB\n",
       levels, size / 1024);

/*****
 * Fifth example:
 * Bind to only one thread of the last core of the machine.
 *
 * First find out where cores are, or else smaller sets of CPUs if
 * the OS doesn't have the notion of a "core".
 ****/
depth = hwloc_get_type_or_below_depth(topology, HWLOC_OBJ_CORE);

/* Get last core. */
obj = hwloc_get_obj_by_depth(topology, depth,
                             hwloc_get_nbobjs_by_depth(topology, depth) - 1);
if (obj) {
    /* Get a copy of its cpuset that we may modify. */
    cpuset = hwloc_cpuset_dup(obj->cpuset);

    /* Get only one logical processor (in case the core is
       SMT/hyperthreaded). */
    hwloc_cpuset_singlify(cpuset);

    /* And try to bind ourself there. */
    if (hwloc_set_cpubind(topology, cpuset, 0)) {
        char *str;
        hwloc_cpuset_asprintf(&str, obj->cpuset);
        printf("Couldn't bind to cpuset %s\n", str);
        free(str);
    }

    /* Free our cpuset copy */
    hwloc_cpuset_free(cpuset);
}

/* Destroy topology object. */
hwloc_topology_destroy(topology);

return 0;
}

```

hwloc provides a `pkg-config` executable to obtain relevant compiler and linker flags. For example, it can be used thusly to compile applications that utilize the hwloc library (assuming GNU Make):

```

CFLAGS += $(pkg-config --cflags hwloc)
LDLIBS += $(pkg-config --libs hwloc)
cc hwloc-hello.c $(CFLAGS) -o hwloc-hello $(LDLIBS)

```

On a machine with 4GB of RAM and 2 processor sockets -- each socket of which has two processing cores -- the output from running `hwloc-hello` could be something like the following:

```
shell$ ./hwloc-hello
*** Objects at level 0
Index 0: Machine(3938MB)
*** Objects at level 1
Index 0: Socket#0
Index 1: Socket#1
*** Objects at level 2
Index 0: Core#0
Index 1: Core#1
Index 2: Core#3
Index 3: Core#2
*** Objects at level 3
Index 0: PU#0
Index 1: PU#1
Index 2: PU#2
Index 3: PU#3
*** Printing overall tree
Machine(3938MB)
  Socket#0
    Core#0
      PU#0
    Core#1
      PU#1
  Socket#1
    Core#3
      PU#2
    Core#2
      PU#3
*** 2 socket(s)
shell$
```

## 1.5 Questions and Bugs

Questions should be sent to the devel mailing list (<http://www.open-mpi.org/community/lists/hwloc.php>).

Bug reports should be reported in the tracker (<https://svn.open-mpi.org/trac/hwloc/>).

If hwloc discovers an incorrect topology for your machine, the very first thing you should check is to ensure that you have the most recent updates installed for your operating system. Indeed, most of hwloc topology discovery relies on hardware information retrieved through the operation system (e.g., via the /sys virtual filesystem of the Linux kernel). If upgrading your OS or Linux kernel does not solve your problem, you may also want to ensure that you are running the most recent version of the BIOS for your machine.

If those things fail, contact us on the mailing list for additional help. Please attach the

output of lstopo after having given the --enable-debug option to ./configure and rebuilt completely, to get debugging output.

## 1.6 History / Credits

hwloc is the evolution and merger of the libtopology (<http://runtime.bordeaux.inria.fr/libtopology/>) project and the Portable Linux Processor Affinity (PLPA) (<http://www.open-mpi.org/projects/plpa/>) project. Because of functional and ideological overlap, these two code bases and ideas were merged and released under the name "hwloc" as an Open MPI sub-project.

libtopology was initially developed by the INRIA Runtime Team-Project (<http://runtime.bordeaux.inria.fr/>) (headed by Raymond Namyst (<http://dept-info.labri.fr/~namyst/>)). PLPA was initially developed by the Open MPI development team as a sub-project. Both are now deprecated in favor of hwloc, which is distributed as an Open MPI sub-project.

# Chapter 2

## Terms and Definitions

**Object** Interesting kind of part of the system, such as a Core, a Cache, a Memory node, etc. The different types detected by hwloc are detailed in the [hwloc\\_obj\\_type\\_t](#) enumeration.

They are topologically sorted by CPU set into a tree.

**CPU set** The set of logical processors (or processing units) logically included in an object (if it makes sense). They are always expressed using physical logical processor numbers (as announced by the OS). They are just masks, they do *not* have any relation with an operating system actual binding notion like Linux' cpusets.

**Parent object** The object logically containing the current object, for example because its CPU set includes the CPU set of the current object.

**Ancestor object** The parent object, or its own parent object, and so on.

**Children object(s)** The object (or objects) contained in the current object because their CPU set is included in the CPU set of the current object.

**Arity** The number of children of an object.

**Sibling objects** Objects of the same type which have the same parent.

**Sibling rank** Index to uniquely identify objects of the same type which have the same parent, and is always in the range [0, parent\_arity).

**Cousin objects** Objects of the same type as the current object.

**Level** Set of objects of the same type.

**OS or physical index** The index that the operating system (OS) uses to identify the object. This may be completely arbitrary, or it may depend on the BIOS configuration.

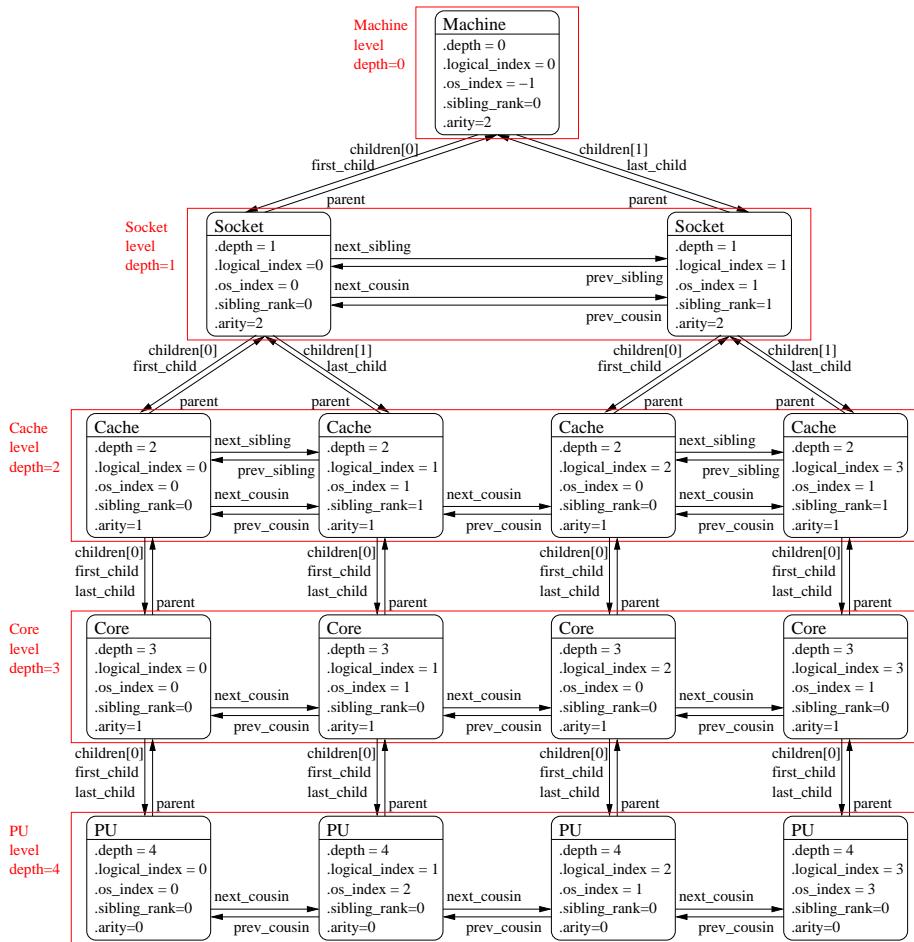

**Depth** Nesting level in the object tree, starting from the 0th object.

**Logical index** Index to uniquely identify objects of the same type. It expresses proximity in a generic way. This index is always linear and in the range [0, num\_objs\_same\_type\_same\_level). Think of it as “cousin rank.” The ordering is based on topology first, and then on OS CPU numbers, so it is stable across everything except firmware CPU renumbering.

### **Logical processor**

**Processing unit** The smallest processing element that can be represented by a hwloc object. It may be a single-core processor, a core of a multicore processor, or a single thread in SMT processor.

The following diagram can help to understand the vocabulary of the relationships by showing the example of a machine with two dual core sockets (with no hardware threads); thus, a topology with 4 levels. Each box with rounded corner corresponds to one hwloc\_obj\_t, containing the values of the different integer fields (depth, logical\_index, etc.), and arrows show to which other hwloc\_obj\_t pointers point to (first\_child, parent, etc.)

It should be noted that for PU objects, the logical index -- as computed linearly by hwloc -- is not the same as the OS index.

# Chapter 3

## Command-line tools

hwloc comes with an extensive C programming interface and several command line utilities. Each of them is fully documented in its own manual page; the following is a summary of the available command line tools.

### 3.1 lstopo

lstopo (also known as hwloc-info and hwloc-ls) displays the hierarchical topology map of the current system. The output may be graphical or textual, and can also be exported to numerous file formats such as PDF, PNG, XML, and others.

Note that lstopo can read XML files and/or alternate chroot filesystems and display topological maps representing those systems (e.g., use lstopo to output an XML file on one system, and then use lstopo to read in that XML file and display it on a different system).

### 3.2 hwloc-bind

hwloc-bind binds processes to specific hardware objects through a flexible syntax. A simple example is binding an executable to specific cores (or sockets or cpusets or ...). The hwloc-bind(1) man page provides much more detail on what is possible.

hwloc-bind can also be used to retrieve the current process' binding.

### 3.3 hwloc-calc

hwloc-calc is generally used to create cpuset strings to pass to hwloc-bind. Although hwloc-bind accepts many forms of object specification (i.e., cpuset strings are one of many forms that hwloc-bind understands), they can be useful, compact representations in shell scripts, for example.

hwloc-calc generates cpuset strings from given hardware objects with the ability to aggregate them, intersect them, and more. hwloc-calc generally uses the same syntax than hwloc-bind, but multiple instances may be composed to generate complex combinations.

Note that hwloc-calc can also generate lists of logical processors or NUMA nodes that are convenient to pass to some external tools such as taskset or numactl.

### 3.4 hwloc-distrib

hwloc-distrib generates a set of cpuset strings that are uniformly distributed across the machine for the given number of processes. These strings may be used with hwloc-bind to run processes to maximize their memory bandwidth by properly distributing them across the machine.

## Chapter 4

# Environment variables

The behavior of the hwloc library and tools may be tuned thanks to the following environment variables.

**HWLOC\_XMLFILE=/path/to/file.xml** enforces the discovery from the given XML file as if [hwloc\\_topology\\_set\\_xml\(\)](#) had been called. This file may have been generated earlier with lstopo file.xml. For convenience, this backend provides empty binding hooks which just return success. To have hwloc still actually call OS-specific hooks, HWLOC\_THISSYSTEM should be set 1 in the environment too, to assert that the loaded file is really the underlying system.

**HWLOC\_FSROOT=/path/to/linux/filesystem-root/** switches to reading the topology from the specified Linux filesystem root instead of the main file-system root, as if [hwloc\\_topology\\_set\\_fsroot\(\)](#) had been called. Not using the main file-system root causes [hwloc\\_topology\\_is\\_thissystem\(\)](#) to return 0. For convenience, this backend provides empty binding hooks which just return success. To have hwloc still actually call OS-specific hooks, HWLOC\_THISSYSTEM should be set 1 in the environment too, to assert that the loaded file is really the underlying system.

**HWLOC\_THISSYSTEM=1** enforces the return value of [hwloc\\_topology\\_is\\_thissystem\(\)](#). It means that it makes hwloc assume that the selected backend provides the topology for the system on which we are running, even if it is not the OS-specific backend but the XML backend for instance. This means making the binding functions actually call the OS-specific system calls and really do binding, while the XML backend would otherwise provide empty hooks just returning success. This can be used for efficiency reasons to first detect the topology once, save it to an XML file, and quickly reload it later through the XML backend, but still having binding functions actually do bind.

## Chapter 5

# Interoperability with other software

Although hwloc offers its own portable interface, it still may have to interoperate with specific or non-portable libraries that manipulate similar kinds of objects. hwloc therefore offers several specific "helpers" to assist converting between those specific interfaces and hwloc.

Some external libraries may be specific to a particular OS; others may not always be available. The hwloc core therefore generally does not explicitly depend on these types of libraries. However, when a custom application uses or otherwise depends on such a library, it may optionally include the corresponding hwloc helper to extend the hwloc interface with dedicated helpers.

**Linux specific features** [hwloc/linux.h](#) offers Linux-specific helpers that utilize some non-portable features of the Linux system, such as binding threads through their thread ID ("tid") or parsing kernel CPU mask files.

**Linux libnuma** [hwloc/linux-libnuma.h](#) provides conversion helpers between hwloc CPU sets and libnuma-specific types, such as nodemasks and bitmasks. It helps you use libnuma memory-binding functions with hwloc CPU sets.

**Glibc** [hwloc/glibc-sched.h](#) offers conversion routines between Glibc and hwloc CPU sets in order to use hwloc with functions such as `sched_setaffinity()`.

**OpenFabrics Verbs** [hwloc/openfabrics-verbs.h](#) helps interoperability with the OpenFabrics Verbs interface. For example, it can return a list of processors near an OpenFabrics device.

# Chapter 6

## Thread safety

Like most libraries that mainly fill data structures, hwloc is not thread safe but rather reentrant: all state is held in a `hwloc_topology_t` instance without mutex protection. That means, for example, that two threads can safely operate on and modify two different `hwloc_topology_t` instances, but they should not simultaneously invoke functions that modify the *same* instance. Similarly, one thread should not modify a `hwloc_topology_t` instance while another thread is reading or traversing it. However, two threads can safely read or traverse the same `hwloc_topology_t` instance concurrently.

When running in multiprocessor environments, be aware that proper thread synchronization and/or memory coherency protection is needed to pass hwloc data (such as `hwloc_topology_t` pointers) from one processor to another (e.g., a mutex, semaphore, or a memory barrier). Note that this is not a hwloc-specific requirement, but it is worth mentioning.

For reference, `hwloc_topology_t` modification operations include (but may not be limited to):

**Creation and destruction** `hwloc_topology_init()`, `hwloc_topology_load()`, `hwloc_topology_destroy()` (see [Create and Destroy Topologies](#)) imply major modifications of the structure, including freeing some objects. No other thread cannot access the topology or any of its objects at the same time.

Also references to objects inside the topology are not valid anymore after these functions return.

**Runtime topology modifications** `hwloc_topology_insert_misc_object_by_*` (see [Tinker with topologies](#).) may modify the topology significantly by adding objects inside the tree, changing the topology depth, etc.

Although references to former objects *may* still be valid after insertion, it is strongly advised to not rely on any such guarantee and always re-consult the

topology to reacquire new instances of objects.

**Locating topologies** `hwloc_topology_ignore*`, `hwloc_topology_set*` (see [Configure Topology Detection](#)) do not modify the topology directly, but they do modify internal structures describing the behavior of the next invocation of `hwloc_topology_load()`. Hence, all of these functions should not be used concurrently.

Note that these functions do not modify the current topology until it is actually reloaded; it is possible to use them while other threads are only read the current topology.

## Chapter 7

# Embedding hwloc in other software

It can be desirable to include hwloc in a larger software package (be sure to check out the LICENSE file) so that users don't have to separately download and install it before installing your software. This can be advantageous to ensure that your software uses a known-tested/good version of hwloc, or for use on systems that do not have hwloc pre-installed.

When used in "embedded" mode, hwloc will:

- not install any header files
- not build any documentation files
- not build or install any executables or tests
- not build `libhwloc.*` -- instead, it will build `libhwloc_embedded.*`

There are two ways to put hwloc into "embedded" mode. The first is directly from the configure command line:

```
shell$ ./configure --enable-embedded-mode ...
```

The second requires that your software project uses the GNU Autoconf / Automake / Libtool tool chain to build your software. If you do this, you can directly integrate hwloc's m4 configure macro into your configure script. You can then invoke hwloc's configuration tests and build setup by calling an m4 macro (see below).

## 7.1 Using hwloc's M4 Embedding Capabilities

Every project is different, and there are many different ways of integrating hwloc into yours. What follows is *one* example of how to do it.

If your project uses recent versions Autoconf, Automake, and Libtool to build, you can use hwloc's embedded m4 capabilities. We have tested the embedded m4 with projects that use Autoconf 2.65, Automake 1.11.1, and Libtool 2.2.6b. Slightly earlier versions of may also work but are untested. Autoconf versions prior to 2.65 are almost certain to not work.

You can either copy all the config/hwloc\*m4 files from the hwloc source tree to the directory where your project's m4 files reside, or you can tell aclocal to find more m4 files in the embedded hwloc's "config" subdirectory (e.g., add "-Ipath/to/embedded/hwloc/config" to your Makefile.am's ACLOCAL\_AMFLAGS).

The following macros can then be used from your configure script (only HWLOC\_SETUP\_CORE *must* be invoked if using the m4 macros):

- HWLOC\_SETUP\_CORE(config-dir-prefix, action-upon-success, action-upon-failure, print\_banner\_or\_not): Invoke the hwloc configuration tests and setup the hwloc tree to build. The first argument is the prefix to use for AC\_OUTPUT files -- it's where the hwloc tree is located relative to \$top\_srcdir. Hence, if your embedded hwloc is located in the source tree at contrib/hwloc, you should pass [contrib/hwloc] as the first argument. If HWLOC\_SETUP\_CORE and the rest of configure completes successfully, then "make" traversals of the hwloc tree with standard Automake targets (all, clean, install, etc.) should behave as expected. For example, it is safe to list the hwloc directory in the SUBDIRS of a higher-level Makefile.am. The last argument, if not empty, will cause the macro to display an announcement banner that it is starting the hwloc core configuration tests.

HWLOC\_SETUP\_CORE will set the following environment variables and AC\_SUBST them: HWLOC\_EMBEDDED\_CFLAGS, HWLOC\_EMBEDDED\_CPPFLAGS, and HWLOC\_EMBEDDED\_LIBS. These flags are filled with the values discovered in the hwloc-specific m4 tests, and can be used in your build process as relevant. The \_CFLAGS, \_CPPFLAGS, and \_LIBS variables are necessary to build libhwloc (or libhwloc\_embedded) itself.

HWLOC\_SETUP\_CORE also sets HWLOC\_EMBEDDED\_LDADD environment variable (and AC\_SUBSTS it) to contain the location of the libhwloc\_embedded.la convenience Libtool archive. It can be used in your build process to link an application or other library against the embedded hwloc library.

**NOTE: If the HWLOC\_SET\_SYMBOL\_PREFIX macro is used, it must be invoked *before* HWLOC\_SETUP\_CORE.**

- HWLOC\_BUILD\_STANDALONE: HWLOC\_SETUP\_CORE defaults to

building hwloc in an "embedded" mode (described above). If HWLOC\_BUILD\_STANDALONE is invoked \*before\* HWLOC\_SETUP\_CORE, the embedded definitions will not apply (e.g., libhwloc.la will be built, not libhwloc\_embedded.la).

- HWLOC\_SET\_SYMBOL\_PREFIX(foo\_): Tells the hwloc to prefix all of hwloc's types and public symbols with "foo\_"; meaning that function hwloc\_init() becomes foo\_hwloc\_init(). Enum values are prefixed with an upper-case translation if the prefix supplied; HWLOC\_OBJ\_SYSTEM becomes FOO\_-HWLOC\_OBJ\_SYSTEM. This is recommended behavior if you are including hwloc in middleware -- it is possible that your software will be combined with other software that links to another copy of hwloc. If both uses of hwloc utilize different symbol prefixes, there will be no type/symbol clashes, and everything will compile, link, and run successfully. If you both embed hwloc without changing the symbol prefix and also link against an external hwloc, you may get multiple symbol definitions when linking your final library or application.
- HWLOC\_SETUP\_DOCS, HWLOC\_SETUP\_UTILS, HWLOC\_SETUP\_TESTS: These three macros only apply when hwloc is built in "standalone" mode (i.e., they should NOT be invoked unless HWLOC\_BUILD\_STANDALONE has already been invoked).
- HWLOC\_DO\_AM\_CONDITIONALS: If you embed hwloc in a larger project and build it conditionally with Automake (e.g., if HWLOC\_SETUP\_CORE is invoked conditionally), you must unconditionally invoke HWLOC\_DO\_AM\_CONDITIONALS to avoid warnings from Automake (for the cases where hwloc is not selected to be built). This macro is necessary because hwloc uses some AM\_CONDITIONALS to build itself, and AM\_CONDITIONALS cannot be defined conditionally. Note that it is safe (but unnecessary) to call HWLOC\_DO\_AM\_CONDITIONALS even if HWLOC\_SETUP\_CORE is invoked unconditionally. If you are not using Automake to build hwloc, this macro is unnecessary (and will actually cause errors because it invoked AM\_\* macros that will be undefined).

<strong>NOTE: When using the HWLOC\_SETUP\_CORE m4 macro, it may be necessary to explicitly invoke AC\_CANONICAL\_TARGET (which requires config.sub and config.guess) and/or AC\_USE\_SYSTEM\_EXTENSIONS macros early in the configuration script (e.g., after AC\_INIT but before AM\_INIT\_AUTOMAKE). See the Autoconf documentation for further information.

Also note that hwloc's top-level configure.ac script uses exactly the macros described above to build hwloc in a standalone mode (by default). You may want to examine it for one example of how these macros are used.

## 7.2 Example Embedding hwloc

Here's an example of integrating with a larger project named sandbox that already uses Autoconf, Automake, and Libtool to build itself:

```
# First, cd into the sandbox project source tree
shell$ cd sandbox
shell$ cp -r /somewhere/else/hwloc-<version> my-embedded-hwloc
shell$ edit Makefile.am
  1. Add "-Imy-embedded-hwloc/config" to ACLOCAL_AMFLAGS
  2. Add "my-embedded-hwloc" to SUBDIRS
  3. Add "$(HWLOC_EMBEDDED_LDADD)" and "$(HWLOC_EMBEDDED_LIBS)" to
     sandbox's executable's LDADD line. The former is the name of the
     Libtool convenience library that hwloc will generate. The latter
     is any dependent support libraries that may be needed by
     $(HWLOC_EMBEDDED_LDADD).
  4. Add "$(HWLOC_EMBEDDED_CFLAGS)" to AM_CFLAGS
  5. Add "$(HWLOC_EMBEDDED_CPPFLAGS)" to AM_CPPFLAGS
shell$ edit configure.ac
  1. Add "HWLOC_SET_SYMBOL_PREFIX(sandbox_hwloc_)" line
  2. Add "HWLOC_SETUP_CORE([my-embedded-hwloc], [happy=yes], [happy=no])" line
  3. Add error checking for happy=no case
shell$ edit sandbox.c
  1. Add #include <hwloc.h>
  2. Add calls to sandbox_hwloc_init() and other hwloc API functions
```

Now you can bootstrap, configure, build, and run the sandbox as normal -- all calls to "sandbox\_hwloc\_\*" will use the embedded hwloc rather than any system-provided copy of hwloc.

# Chapter 8

## Switching from PLPA to hwloc

Although PLPA and hwloc share some of the same ideas, their programming interfaces are quite different. After much debate, it was decided *not* to emulate the PLPA API with hwloc's API because hwloc's API is already far more rich than PLPA's.

More specifically, exploiting modern computing architecture *requires* the flexible functionality provided by the hwloc API -- the PLPA API is too rigid in its definitions and practices to handle the evolving server hardware landscape (e.g., PLPA only understands cores and sockets; hwloc understands a much larger set of hardware objects).

As such, even though it is fully possible to emulate the PLPA API with hwloc (e.g., only deal with sockets and cores), and while the documentation below describes how to do this, we encourage any existing PLPA application authors to actually re-think their application in terms of more than just sockets and cores. In short, we encourage you to use the full hwloc API to exploit *all* the hardware.

### 8.1 Topology Context vs. Caching

First, all hwloc functions take a `topology` parameter. This parameter serves as an internal storage for the result of the topology discovery. It replaces PLPA's caching abilities and even lets you manipulate multiple topologies at the same time, if needed.

Thus, all programs should first run `hwloc_topology_init()` and `hwloc_topology_destroy()` as they did `plpa_init()` and `plpa_finalize()` in the past.

### 8.2 Hierarchy vs. Core@Socket

PLPA was designed to understand only cores and sockets. hwloc offers many more different types of objects (e.g., cores, sockets, hardware threads, NUMA nodes, and

others) and stores them within a tree of resources.

To emulate the PLPA model, it is possible to find sockets using functions such as [hwloc\\_get\\_obj\\_by\\_type\(\)](#). Iterating over sockets is also possible using [hwloc\\_get\\_next\\_obj\\_by\\_type\(\)](#). Then, finding a core within a socket may be done using [hwloc\\_get\\_obj\\_inside\\_cpuset\\_by\\_type\(\)](#) or [hwloc\\_get\\_next\\_obj\\_inside\\_cpuset\\_by\\_type\(\)](#).

It is also possible to directly find an object "below" another object using [hwloc\\_get\\_obj\\_below\\_by\\_type\(\)](#) (or [hwloc\\_get\\_obj\\_below\\_array\\_by\\_type\(\)](#)).

### 8.3 Logical vs. Physical/OS Indexes

hwloc manipulates logical indexes, meaning indexes specified with regard to the ordering of objects in the hwloc-provided hierarchical tree. Physical or OS indexes may be entirely hidden if not strictly required. The reason for this is that physical/OS indexes may change with the OS or with the BIOS version. They may be non-consecutive, multiple objects may have the same physical/OS indexes, making their manipulation tricky and highly non-portable.

Note that hwloc tries very hard to always present a hierarchical tree with the same logical ordering, regardless of physical or OS index ordering.

It is still possible to retrieve physical/OS indexes through the `os_index` field of objects, but such practice should be avoided as much as possible for the reasons described above (except perhaps for prettyprinting / debugging purposes).

`HWLOC_OBJ_PU` objects are supposed to have different physical/OS indexes since the OS uses them for binding. The `os_index` field of these objects provides the identifier that may be used for such binding, and `hwloc_get_proc_obj_by_os_index()` finds the object associated with a specific OS index.

But as mentioned above, we discourage the use of these conversion methods for actual binding. Instead, hwloc offers its own binding model using the `cpuset` field of objects. These cpusets may be duplicated, modified, combined, etc. (see [hwloc/cpuset.h](#) for details) and then passed to [hwloc\\_set\\_cpubind\(\)](#) for binding.

### 8.4 Counting Specification

PLPA offers a `countspec` parameter to specify whether counting all CPUs, only the online ones or only the offline ones. However, some operating systems do not expose the topology of offline CPUs (i.e., offline CPUs are not reported at all by the OS). Also, some processors may not be visible to the current application due to administrative restrictions. Finally, some processors let you shutdown a single hardware thread in a core, making some of the PLPA features irrelevant.

hwloc stores in the hierarchical tree of objects all CPUs that have known topology

information. It then provides the applications with several cpusets that contain the list of CPUs that are actually known, that have topology information, that are online, or that are available to the application. These cpusets may be retrieved with [hwloc\\_topology\\_get\\_online\\_cpuset\(\)](#) and other similar functions to filter the object that are relevant or not.

## Module Index

### 9.1 Modules

Here is a list of all modules:

API version . . . . .	41
Topology context . . . . .	41
Topology Object Types . . . . .	42
Topology Objects . . . . .	44
Create and Destroy Topologies . . . . .	45
Configure Topology Detection . . . . .	46
Tinker with topologies. . . . .	51
Get some Topology Information . . . . .	52
Retrieve Objects . . . . .	55
Object/String Conversion . . . . .	55
Binding . . . . .	58
Object Type Helpers . . . . .	62
Basic Traversal Helpers . . . . .	62
Finding Objects Inside a CPU set . . . . .	66
Finding a single Object covering at least CPU set . . . . .	68
Finding a set of similar Objects covering at least a CPU set . . . . .	69
Cache-specific Finding Helpers . . . . .	70
Advanced Traversal Helpers . . . . .	71
Binding Helpers . . . . .	73
Cpuset Helpers . . . . .	73
The Cpuset API . . . . .	75
Helpers for manipulating glibc sched affinity . . . . .	85
Linux-only helpers . . . . .	86
Helpers for manipulating Linux libnuma unsigned long masks . . . . .	87
Helpers for manipulating Linux libnuma bitmask . . . . .	88

Helpers for manipulating Linux libnuma nodemask_t . . . . .	89
OpenFabrics-Specific Functions . . . . .	90

## Data Structure Index

### 10.1 Data Structures

Here are the data structures with brief descriptions:

<code>hwloc_obj_attr_u::hwloc_cache_attr_s</code> (Cache-specific Object Attributes) . . .	91
<code>hwloc_obj_attr_u::hwloc_group_attr_s</code> (Group-specific Object Attributes) . . .	92
<code>hwloc_obj_attr_u::hwloc_machine_attr_s</code> (Machine-specific Object At- tributes) . . . . .	92
<code>hwloc_obj</code> (Structure of a topology object) . . . . .	93
<code>hwloc_obj_attr_u</code> (Object type-specific Attributes) . . . . .	100
<code>hwloc_obj_memory_s::hwloc_obj_memory_page_type_s</code> (Array of local memory page types, NULL if no local memory and page_types is 0) . . . . .	101
<code>hwloc_obj_memory_s</code> (Object memory) . . . . .	102
<code>hwloc_topology_cpubind_support</code> (Flags describing actual binding support for this topology) . . . . .	103
<code>hwloc_topology_discovery_support</code> (Flags describing actual discovery sup- port for this topology) . . . . .	105
<code>hwloc_topology_support</code> (Set of flags describing actual support for this topology) . . . . .	105

# Chapter 11

## Module Documentation

### 11.1 API version

#### Defines

- `#define HWLOC_API_VERSION 0x00010000`

*Indicate at build time which hwloc API version is being used.*

#### 11.1.1 Define Documentation

##### 11.1.1.1 `#define HWLOC_API_VERSION 0x00010000`

Indicate at build time which hwloc API version is being used.

### 11.2 Topology context

#### Typedefs

- `typedef struct hwloc_topology *hwloc_topology_t`

*Topology context.*

### 11.2.1 Typedef Documentation

#### 11.2.1.1 `typedef struct hwloc_topology* hwloc_topology_t`

Topology context.

To be initialized with `hwloc_topology_init()` and built with `hwloc_topology_load()`.

## 11.3 Topology Object Types

### Enumerations

- enum `hwloc_obj_type_t` {
   
`HWLOC_OBJ_SYSTEM, HWLOC_OBJ_MACHINE, HWLOC_OBJ_NODE,`  
`HWLOC_OBJ_SOCKET,`  
`HWLOC_OBJ_CACHE,      HWLOC_OBJ_CORE,      HWLOC_OBJ_PU,`  
`HWLOC_OBJ_GROUP,`  
`HWLOC_OBJ_MISC }`

*Type of topology object.*

- enum `hwloc_compare_types_e` { `HWLOC_TYPE_UNORDERED` }

### Functions

- `HWLOC_DECLSPEC int hwloc_compare_types (hwloc_obj_type_t type1, hwloc_obj_type_t type2) __hwloc_attribute_const`

*Compare the depth of two object types.*

### 11.3.1 Enumeration Type Documentation

#### 11.3.1.1 `enum hwloc_compare_types_e`

Enumerator:

**`HWLOC_TYPE_UNORDERED`** Value returned by `hwloc_compare_types` when types can not be compared.

### 11.3.1.2 enum hwloc\_obj\_type\_t

Type of topology object.

#### Note

Do not rely on the ordering or completeness of the values as new ones may be defined in the future! If you need to compare types, use [hwloc\\_compare\\_types\(\)](#) instead.

#### Enumerator:

***HWLOC\_OBJ\_SYSTEM*** Whole system (may be a cluster of machines). The whole system that is accessible to hwloc. That may comprise several machines in SSI systems like Kerrighed.

***HWLOC\_OBJ\_MACHINE*** Machine. The typical root object type. A set of processors and memory with cache coherency.

***HWLOC\_OBJ\_NODE*** NUMA node. A set of processors around memory which the processors can directly access.

***HWLOC\_OBJ\_SOCKET*** Socket, physical package, or chip. In the physical meaning, i.e. that you can add or remove physically.

***HWLOC\_OBJ\_CACHE*** Data cache. Can be L1, L2, L3, ...

***HWLOC\_OBJ\_CORE*** Core. A computation unit (may be shared by several logical processors).

***HWLOC\_OBJ\_PU*** Processing Unit, or (Logical) Processor. An execution unit (may share a core with some other logical processors, e.g. in the case of an SMT core). Objects of this kind are always reported and can thus be used as fallback when others are not.

***HWLOC\_OBJ\_GROUP*** Group objects. Objects which do not fit in the above but are detected by hwloc and are useful to take into account for affinity. For instance, some OSes expose their arbitrary processors aggregation this way. And hwloc may insert such objects to group NUMA nodes according to their distances. These objects are ignored when they do not bring any structure.

***HWLOC\_OBJ\_MISC*** Miscellaneous objects. Objects without particular meaning, that can e.g. be added by the application for its own use.

### 11.3.2 Function Documentation

#### 11.3.2.1 HWLOC\_DECLSPEC int hwloc\_compare\_types ( hwloc\_obj\_type\_t type1, hwloc\_obj\_type\_t type2 ) const

Compare the depth of two object types.

Types shouldn't be compared as they are, since newer ones may be added in the future. This function returns less than, equal to, or greater than zero respectively if type1 objects usually include type2 objects, are the same as type2 objects, or are included in type2 objects. If the types can not be compared (because neither is usually contained in the other), HWLOC\_TYPE\_UNORDERED is returned. Object types containing CPUs can always be compared (usually, a system contains machines which contain nodes which contain sockets which contain caches, which contain cores, which contain processors).

#### Note

HWLOC\_OBJ\_PU will always be the deepest.

This does not mean that the actual topology will respect that order: e.g. as of today cores may also contain caches, and sockets may also contain nodes. This is thus just to be seen as a fallback comparison method.

## 11.4 Topology Objects

### Data Structures

- struct [hwloc\\_obj\\_memory\\_s](#)  
*Object memory.*
- struct [hwloc\\_obj](#)  
*Structure of a topology object.*
- union [hwloc\\_obj\\_attr\\_u](#)  
*Object type-specific Attributes.*

### Typedefs

- typedef struct [hwloc\\_obj](#) \* [hwloc\\_obj\\_t](#)  
*Convenience typedef; a pointer to a struct [hwloc\\_obj](#).*

### 11.4.1 Typedef Documentation

#### 11.4.1.1 [typedef struct hwloc\\_obj\\*](#) [hwloc\\_obj\\_t](#)

Convenience typedef; a pointer to a struct [hwloc\\_obj](#).

## 11.5 Create and Destroy Topologies

### Functions

- HWLOC\_DECLSPEC int [hwloc\\_topology\\_init](#) ([hwloc\\_topology\\_t](#) \*topology)  
*Allocate a topology context.*
- HWLOC\_DECLSPEC int [hwloc\\_topology\\_load](#) ([hwloc\\_topology\\_t](#) topology)  
*Build the actual topology.*
- HWLOC\_DECLSPEC void [hwloc\\_topology\\_destroy](#) ([hwloc\\_topology\\_t](#) topology)  
*Terminate and free a topology context.*
- HWLOC\_DECLSPEC void [hwloc\\_topology\\_check](#) ([hwloc\\_topology\\_t](#) topology)  
*Run internal checks on a topology structure.*

### 11.5.1 Function Documentation

#### 11.5.1.1 HWLOC\_DECLSPEC void [hwloc\\_topology\\_check](#) ( [hwloc\\_topology\\_t](#) topology )

Run internal checks on a topology structure.

##### Parameters

*topology* is the topology to be checked

#### 11.5.1.2 HWLOC\_DECLSPEC void [hwloc\\_topology\\_destroy](#) ( [hwloc\\_topology\\_t](#) topology )

Terminate and free a topology context.

##### Parameters

*topology* is the topology to be freed

### 11.5.1.3 HWLOC\_DECLSPEC int hwloc\_topology\_init ( *hwloc\_topology\_t* \* *topologyp* )

Allocate a topology context.

#### Parameters

[out] *topologyp* is assigned a pointer to the new allocated context.

#### Returns

0 on success, -1 on error.

### 11.5.1.4 HWLOC\_DECLSPEC int hwloc\_topology\_load ( *hwloc\_topology\_t* *topology* )

Build the actual topology.

Build the actual topology once initialized with [hwloc\\_topology\\_init\(\)](#) and tuned with [Configure Topology Detection](#) routines. No other routine may be called earlier using this topology context.

#### Parameters

*topology* is the topology to be loaded with objects.

#### Returns

0 on success, -1 on error.

#### See also

[Configure Topology Detection](#)

## 11.6 Configure Topology Detection

### Data Structures

- struct [hwloc\\_topology\\_discovery\\_support](#)  
*Flags describing actual discovery support for this topology.*
- struct [hwloc\\_topology\\_cpubind\\_support](#)  
*Flags describing actual binding support for this topology.*
- struct [hwloc\\_topology\\_support](#)  
*Set of flags describing actual support for this topology.*

## Enumerations

- enum `hwloc_topology_flags_e` { `HWLOC_TOPOLOGY_FLAG_WHOLE_SYSTEM`, `HWLOC_TOPOLOGY_FLAG_IS_THISSYSTEM` }

*Flags to be set onto a topology context before load.*

## Functions

- HWLOC\_DECLARESPEC int `hwloc_topology_ignore_type` (`hwloc_topology_t` topology, `hwloc_obj_type_t` type)

*Ignore an object type.*

- HWLOC\_DECLARESPEC int `hwloc_topology_ignore_type_keep_structure` (`hwloc_topology_t` topology, `hwloc_obj_type_t` type)

*Ignore an object type if it does not bring any structure.*

- HWLOC\_DECLARESPEC int `hwloc_topology_ignore_all_keep_structure` (`hwloc_topology_t` topology)

*Ignore all objects that do not bring any structure.*

- HWLOC\_DECLARESPEC int `hwloc_topology_set_flags` (`hwloc_topology_t` topology, unsigned long flags)

*Set OR'ed flags to non-yet-loaded topology.*

- HWLOC\_DECLARESPEC int `hwloc_topology_set_fsroot` (`hwloc_topology_t` \_\_hwloc\_restrict topology, const char \*\_\_hwloc\_restrict fsroot\_path)

*Change the file-system root path when building the topology from sysfs/procfs.*

- HWLOC\_DECLARESPEC int `hwloc_topology_set_pid` (`hwloc_topology_t` \_\_hwloc\_restrict topology, `hwloc_pid_t` pid)

*Change which pid the topology is viewed from.*

- HWLOC\_DECLARESPEC int `hwloc_topology_set_synthetic` (`hwloc_topology_t` \_\_hwloc\_restrict topology, const char \*\_\_hwloc\_restrict description)

*Enable synthetic topology.*

- HWLOC\_DECLARESPEC int `hwloc_topology_set_xml` (`hwloc_topology_t` \_\_hwloc\_restrict topology, const char \*\_\_hwloc\_restrict xmlpath)

*Enable XML-file based topology.*

- HWLOC\_DECLARESPEC struct `hwloc_topology_support` \* `hwloc_topology_get_support` (`hwloc_topology_t` \_\_hwloc\_restrict topology)

*Retrieve the topology support.*

### 11.6.1 Detailed Description

These functions can optionally be called between [hwloc\\_topology\\_init\(\)](#) and [hwloc\\_topology\\_load\(\)](#) to configure how the detection should be performed, e.g. to ignore some objects types, define a synthetic topology, etc.

If none of them is called, the default is to detect all the objects of the machine that the caller is allowed to access.

This default behavior may also be modified through environment variables if the application did not modify it already. Setting HWLOC\_XMLFILE in the environment enforces the discovery from a XML file as if [hwloc\\_topology\\_set\\_xml\(\)](#) had been called. HWLOC\_FSROOT switches to reading the topology from the specified Linux filesystem root as if [hwloc\\_topology\\_set\\_fsroot\(\)](#) had been called. Finally, HWLOC\_THISSYSTEM enforces the return value of [hwloc\\_topology\\_is\\_thissystem\(\)](#).

### 11.6.2 Enumeration Type Documentation

#### 11.6.2.1 enum hwloc\_topology\_flags\_e

Flags to be set onto a topology context before load.

Flags should be given to [hwloc\\_topology\\_set\\_flags\(\)](#).

**Enumerator:**

**HWLOC\_TOPOLOGY\_FLAG\_WHOLE\_SYSTEM** Detect the whole system, ignore reservations and offline settings. Gather all resources, even if some were disabled by the administrator. For instance, ignore Linux Cpusets and gather all processors and memory nodes, and ignore the fact that some resources may be offline.

**HWLOC\_TOPOLOGY\_FLAG\_IS\_THISSYSTEM** Assume that the selected backend provides the topology for the system on which we are running. This forces `hwloc_topology_is_thissystem` to return 1, i.e. makes `hwloc` assume that the selected backend provides the topology for the system on which we are running, even if it is not the OS-specific backend but the XML backend for instance. This means making the binding functions actually call the OS-specific system calls and really do binding, while the XML backend would otherwise provide empty hooks just returning success.

Setting the environment variable HWLOC\_THISSYSTEM may also result in the same behavior.

This can be used for efficiency reasons to first detect the topology once, save it to an XML file, and quickly reload it later through the XML backend, but

still having binding functions actually do bind.

### 11.6.3 Function Documentation

**11.6.3.1 HWLOC\_DECLSPEC struct hwloc\_topology\_support\*  
hwloc\_topology\_get\_support ( hwloc\_topology\_t \_\_hwloc\_restrict  
topology ) [read]**

Retrieve the topology support.

**11.6.3.2 HWLOC\_DECLSPEC int hwloc\_topology\_ignore\_all\_keep\_structure  
( hwloc\_topology\_t topology )**

Ignore all objects that do not bring any structure.

Ignore all objects that do not bring any structure: Each ignored object should have a single children or be the only child of its parent.

**11.6.3.3 HWLOC\_DECLSPEC int hwloc\_topology\_ignore\_type (**  
**hwloc\_topology\_t topology, hwloc\_obj\_type\_t type )**

Ignore an object type.

Ignore all objects from the given type. The bottom-level type HWLOC\_OBJ\_PU may not be ignored. The top-level object of the hierarchy will never be ignored, even if this function succeeds.

**11.6.3.4 HWLOC\_DECLSPEC int hwloc\_topology\_ignore\_type\_keep\_-  
structure ( hwloc\_topology\_t topology, hwloc\_obj\_type\_t type  
)**

Ignore an object type if it does not bring any structure.

Ignore all objects from the given type as long as they do not bring any structure: Each ignored object should have a single children or be the only child of its parent. The bottom-level type HWLOC\_OBJ\_PU may not be ignored.

**11.6.3.5 HWLOC\_DECLSPEC int hwloc\_topology\_set\_flags (**  
**hwloc\_topology\_t topology, unsigned long flags )**

Set OR'ed flags to non-yet-loaded topology.

Set a OR'ed set of hwloc\_topology\_flags\_e onto a topology that was not yet loaded.

---

**11.6.3.6 HWLOC\_DECLSPEC int hwloc\_topology\_set\_fsroot (**  
**hwloc\_topology\_t \_\_hwloc\_restrict topology, const char**  
**\*\_\_hwloc\_restrict fsroot\_path )**

Change the file-system root path when building the topology from sysfs/procfs.

On Linux system, use sysfs and procfs files as if they were mounted on the given `fsroot_path` instead of the main file-system root. Setting the environment variable `HWLOC_FSROOT` may also result in this behavior. Not using the main file-system root causes [hwloc\\_topology\\_is\\_thissystem\(\)](#) to return 0.

#### Note

For convenience, this backend provides empty binding hooks which just return success. To have hwloc still actually call OS-specific hooks, the `HWLOC_TOPOLOGY_FLAG_IS_THISSYSTEM` has to be set to assert that the loaded file is really the underlying system.

---

**11.6.3.7 HWLOC\_DECLSPEC int hwloc\_topology\_set\_pid ( hwloc\_topology\_t**  
**\_\_hwloc\_restrict topology, hwloc\_pid\_t pid )**

Change which pid the topology is viewed from.

On some systems, processes may have different views of the machine, for instance the set of allowed CPUs. By default, hwloc exposes the view from the current process. Calling [hwloc\\_topology\\_set\\_pid\(\)](#) permits to make it expose the topology of the machine from the point of view of another process.

#### Note

`hwloc_pid_t` is `pid_t` on unix platforms, and `HANDLE` on native Windows platforms

The `ENOSYS` error is returned on platforms that does not support this feature.

---

**11.6.3.8 HWLOC\_DECLSPEC int hwloc\_topology\_set\_synthetic**  
**( hwloc\_topology\_t \_\_hwloc\_restrict topology, const char**  
**\*\_\_hwloc\_restrict description )**

Enable synthetic topology.

Gather topology information from the given `description` which should be a comma separated string of numbers describing the arity of each level. Each number may be prefixed with a type and a colon to enforce the type of a level. If only some level types are enforced, hwloc will try to choose the other types according to usual topologies, but it may fail and you may have to specify more level types manually.

**Note**

For convenience, this backend provides empty binding hooks which just return success.

```
11.6.3.9 HWLOC_DECLSPEC int hwloc_topology_set_xml (
    hwloc_topology_t __hwloc_restrict topology, const char
    *__hwloc_restrict xmlpath )
```

Enable XML-file based topology.

Gather topology information from the XML file given at `xmlpath`. Setting the environment variable `HWLOC_XMLFILE` may also result in this behavior. This file may have been generated earlier with `lstopo file.xml`.

**Note**

For convenience, this backend provides empty binding hooks which just return success. To have `hwloc` still actually call OS-specific hooks, the `HWLOC_TOPOLOGY_FLAG_IS_THISSYSTEM` has to be set to assert that the loaded file is really the underlying system.

## 11.7 Tinker with topologies.

### Functions

- `HWLOC_DECLSPEC void hwloc_topology_export_xml (hwloc_topology_t topology, const char *xmlpath)`

*Export the topology into an XML file.*

- `HWLOC_DECLSPEC hwloc_obj_t hwloc_topology_insert_misc_object_by_cpuset (hwloc_topology_t topology, hwloc_const_cpuset_t cpuset, const char *name)`

*Add a MISC object to the topology.*

- `HWLOC_DECLSPEC hwloc_obj_t hwloc_topology_insert_misc_object_by_parent (hwloc_topology_t topology, hwloc_obj_t parent, const char *name)`

*Add a MISC object to the topology.*

### 11.7.1 Function Documentation

**11.7.1.1 HWLOC\_DECLARES void hwloc\_topology\_export\_xml ( hwloc\_topology\_t topology, const char \* xmlpath )**

Export the topology into an XML file.

This file may be loaded later through [hwloc\\_topology\\_set\\_xml\(\)](#).

**11.7.1.2 HWLOC\_DECLARES hwloc\_obj\_t hwloc\_topology\_insert\_misc\_object\_by\_cpuset ( hwloc\_topology\_t topology, hwloc\_const\_cpuset\_t cpuset, const char \* name )**

Add a MISC object to the topology.

A new MISC object will be created and inserted into the topology at the position given by cpuset.

cpuset and name will be copied.

#### Returns

the newly-created object

**11.7.1.3 HWLOC\_DECLARES hwloc\_obj\_t hwloc\_topology\_insert\_misc\_object\_by\_parent ( hwloc\_topology\_t topology, hwloc\_obj\_t parent, const char \* name )**

Add a MISC object to the topology.

A new MISC object will be created and inserted into the topology at the position given by parent.

name will be copied.

#### Returns

the newly-created object

## 11.8 Get some Topology Information

### Enumerations

- enum `hwloc_get_type_depth_e` { `HWLOC_TYPE_DEPTH_UNKNOWN`, `HWLOC_TYPE_DEPTH_MULTIPLE` }

## Functions

- HWLOC\_DECLSPEC unsigned `hwloc_topology_get_depth` (`hwloc_topology_t` \_\_`hwloc_restrict topology`) \_\_`hwloc_attribute_pure`

*Get the depth of the hierarchical tree of objects.*
- HWLOC\_DECLSPEC int `hwloc_get_type_depth` (`hwloc_topology_t` `topology`, `hwloc_obj_type_t` `type`)

*Returns the depth of objects of type type.*
- HWLOC\_DECLSPEC `hwloc_obj_type_t` `hwloc_get_depth_type` (`hwloc_topology_t` `topology`, unsigned `depth`) \_\_`hwloc_attribute_pure`

*Returns the type of objects at depth depth.*
- HWLOC\_DECLSPEC unsigned `hwloc_get_nbobjs_by_depth` (`hwloc_topology_t` `topology`, unsigned `depth`) \_\_`hwloc_attribute_pure`

*Returns the width of level at depth depth.*
- static \_\_`hwloc_inline` int \_\_`hwloc_attribute_pure` `hwloc_get_nbobjs_by_type` (`hwloc_topology_t` `topology`, `hwloc_obj_type_t` `type`)

*Returns the width of level type type.*
- HWLOC\_DECLSPEC int `hwloc_topology_is_thissystem` (`hwloc_topology_t` \_\_`hwloc_restrict topology`) \_\_`hwloc_attribute_pure`

*Does the topology context come from this system?*

### 11.8.1 Enumeration Type Documentation

#### 11.8.1.1 enum `hwloc_get_type_depth_e`

**Enumerator:**

**`HWLOC_TYPE_DEPTH_UNKNOWN`** No object of given type exists in the topology.

**`HWLOC_TYPE_DEPTH_MULTIPLE`** Objects of given type exist at different depth in the topology.

### 11.8.2 Function Documentation

#### 11.8.2.1 HWLOC\_DECLSPEC `hwloc_obj_type_t` `hwloc_get_depth_type` (`hwloc_topology_t` *topology*, unsigned *depth* )

Returns the type of objects at depth depth.

**Returns**

-1 if depth `depth` does not exist.

**11.8.2.2 HWLOC\_DECLSPEC unsigned hwloc\_get\_nbobjs\_by\_depth ( hwloc\_topology\_t *topology*, unsigned *depth* )**

Returns the width of level at depth `depth`.

**11.8.2.3 static \_\_hwloc\_inline int \_\_hwloc\_attribute\_pure  
hwloc\_get\_nbobjs\_by\_type ( hwloc\_topology\_t *topology*,  
hwloc\_obj\_type\_t *type* ) [static]**

Returns the width of level type `type`.

If no object for that type exists, 0 is returned. If there are several levels with objects of that type, -1 is returned.

**11.8.2.4 HWLOC\_DECLSPEC int hwloc\_get\_type\_depth ( hwloc\_topology\_t  
*topology*, hwloc\_obj\_type\_t *type* )**

Returns the depth of objects of type `type`.

If no object of this type is present on the underlying architecture, or if the OS doesn't provide this kind of information, the function returns `HWLOC_TYPE_DEPTH_UNKNOWN`.

If `type` is absent but a similar type is acceptable, see also [hwloc\\_get\\_type\\_or\\_below\\_depth\(\)](#) and [hwloc\\_get\\_type\\_or\\_above\\_depth\(\)](#).

**11.8.2.5 HWLOC\_DECLSPEC unsigned hwloc\_topology\_get\_depth ( hwloc\_topology\_t \_\_hwloc\_restrict *topology* )**

Get the depth of the hierarchical tree of objects.

This is the depth of `HWLOC_OBJ_PU` objects plus one.

**11.8.2.6 HWLOC\_DECLSPEC int hwloc\_topology\_is\_thissystem ( hwloc\_topology\_t \_\_hwloc\_restrict *topology* )**

Does the topology context come from this system?

**Returns**

1 if this topology context was built using the system running this program.

0 instead (for instance if using another file-system root, a XML topology file, or a synthetic topology).

## 11.9 Retrieve Objects

### Functions

- HWLOC\_DECLSPEC `hwloc_obj_t hwloc_get_obj_by_depth (hwloc_topology_t topology, unsigned depth, unsigned idx) __hwloc_attribute_pure`  
*Returns the topology object at index `index` from depth `depth`.*
- static \_\_hwloc\_inline `hwloc_obj_t __hwloc_attribute_pure hwloc_get_obj_by_type (hwloc_topology_t topology, hwloc_obj_type_t type, unsigned idx)`  
*Returns the topology object at index `index` with type `type`.*

### 11.9.1 Function Documentation

#### 11.9.1.1 HWLOC\_DECLSPEC `hwloc_obj_t hwloc_get_obj_by_depth (hwloc_topology_t topology, unsigned depth, unsigned idx )`

Returns the topology object at index `index` from depth `depth`.

#### 11.9.1.2 static \_\_hwloc\_inline `hwloc_obj_t __hwloc_attribute_pure hwloc_get_obj_by_type ( hwloc_topology_t topology, hwloc_obj_type_t type, unsigned idx ) [static]`

Returns the topology object at index `index` with type `type`.

If no object for that type exists, NULL is returned. If there are several levels with objects of that type, NULL is returned and the caller may fallback to `hwloc_get_obj_by_depth()`.

## 11.10 Object/String Conversion

### Functions

- HWLOC\_DECLSPEC const char \* `hwloc_obj_type_string (hwloc_obj_type_t type) __hwloc_attribute_const`  
*Return a stringified topology object type.*

- HWLOC\_DECLARESPEC `hwloc_obj_type_t hwloc_obj_type_of_string (const char *string) __hwloc_attribute_pure`  
*Return an object type from the string.*
- HWLOC\_DECLARESPEC int `hwloc_obj_type_snprintf (char *__hwloc_restrict string, size_t size, hwloc_obj_t obj, int verbose)`  
*Stringify the type of a given topology object into a human-readable form.*
- HWLOC\_DECLARESPEC int `hwloc_obj_attr_snprintf (char *__hwloc_restrict string, size_t size, hwloc_obj_t obj, const char *__hwloc_restrict separator, int verbose)`  
*Stringify the attributes of a given topology object into a human-readable form.*
- HWLOC\_DECLARESPEC int `hwloc_obj_snprintf (char *__hwloc_restrict string, size_t size, hwloc_topology_t topology, hwloc_obj_t obj, const char *__hwloc_restrict indexprefix, int verbose)`  
*Stringify a given topology object into a human-readable form.*
- HWLOC\_DECLARESPEC int `hwloc_obj_cpuset_snprintf (char *__hwloc_restrict str, size_t size, size_t nobj, const hwloc_obj_t *__hwloc_restrict objs)`  
*Stringify the cpuset containing a set of objects.*

### 11.10.1 Function Documentation

**11.10.1.1 HWLOC\_DECLARESPEC int hwloc\_obj\_attr\_snprintf ( char  
`*__hwloc_restrict string, size_t size, hwloc_obj_t obj, const char  
*__hwloc_restrict separator, int verbose )`**

Stringify the attributes of a given topology object into a human-readable form.

Attribute values are separated by separator.

Only the major attributes are printed in non-verbose mode.

#### Returns

how many characters were actually written (not including the ending \0), or -1 on error.

**11.10.1.2 HWLOC\_DECLARESPEC int hwloc\_obj\_cpuset\_snprintf ( char  
`*__hwloc_restrict str, size_t size, size_t nobj, const hwloc_obj_t  
*__hwloc_restrict objs )`**

Stringify the cpuset containing a set of objects.

**Returns**

how many characters were actually written (not including the ending \0).

**11.10.1.3 HWLOC\_DECLSPEC int hwloc\_obj\_snprintf ( char  
\*\_\_hwloc\_restrict string, size\_t size, hwloc\_topology\_t topology,  
hwloc\_obj\_t obj, const char \*\_\_hwloc\_restrict indexprefix, int  
verbose )**

Stringify a given topology object into a human-readable form.

**Note**

This function is deprecated in favor of [hwloc\\_obj\\_type\\_snprintf\(\)](#) and [hwloc\\_obj\\_attr\\_snprintf\(\)](#) since it is not very flexible and only prints physical/OS indexes.

Fill string `string` up to `size` characters with the description of topology object `obj` in topology `topology`.

If `verbose` is set, a longer description is used. Otherwise a short description is used. `indexprefix` is used to prefix the `os_index` attribute number of the object in the description. If `NULL`, the `#` character is used.

**Returns**

how many characters were actually written (not including the ending \0), or -1 on error.

**11.10.1.4 HWLOC\_DECLSPEC hwloc\_obj\_type\_t hwloc\_obj\_type\_of\_string ( const char \* string )**

Return an object type from the string.

**Returns**

-1 if unrecognized.

**11.10.1.5 HWLOC\_DECLSPEC int hwloc\_obj\_type\_snprintf ( char  
\*\_\_hwloc\_restrict string, size\_t size, hwloc\_obj\_t obj, int verbose )**

Stringify the type of a given topology object into a human-readable form.

It differs from [hwloc\\_obj\\_type\\_string\(\)](#) because it prints type attributes such as cache depth.

**Returns**

how many characters were actually written (not including the ending \0), or -1 on error.

**11.10.1.6 HWLOC\_DECLSPEC const char\* hwloc\_obj\_type\_string (hwloc\_obj\_type\_t type ) const**

Return a stringified topology object type.

## 11.11 Binding

### Enumerations

- enum **hwloc\_cpubind\_policy\_t** { **HWLOC\_CPUBIND\_PROCESS**, **HWLOC\_CPUBIND\_THREAD**, **HWLOC\_CPUBIND\_STRICT** }

*Process/Thread binding policy.*

### Functions

- **HWLOC\_DECLSPEC int hwloc\_set\_cpubind (hwloc\_topology\_t topology, hwloc\_const\_cpuset\_t set, int policy)**  
*Bind current process or thread on cpus given in cpuset set.*
- **HWLOC\_DECLSPEC int hwloc\_get\_cpubind (hwloc\_topology\_t topology, hwloc\_cpuset\_t set, int policy)**  
*Get current process or thread binding.*
- **HWLOC\_DECLSPEC int hwloc\_set\_proc\_cpubind (hwloc\_topology\_t topology, hwloc\_pid\_t pid, hwloc\_const\_cpuset\_t set, int policy)**  
*Bind a process pid on cpus given in cpuset set.*
- **HWLOC\_DECLSPEC int hwloc\_get\_proc\_cpubind (hwloc\_topology\_t topology, hwloc\_pid\_t pid, hwloc\_cpuset\_t set, int policy)**  
*Get the current binding of process pid.*
- **HWLOC\_DECLSPEC int hwloc\_set\_thread\_cpubind (hwloc\_topology\_t topology, hwloc\_thread\_t tid, hwloc\_const\_cpuset\_t set, int policy)**  
*Bind a thread tid on cpus given in cpuset set.*

- HWLOC\_DECLSPEC int `hwloc_get_thread_cpubind` (`hwloc_topology_t` topology, `hwloc_thread_t` tid, `hwloc_cpuset_t` set, int policy)

*Get the current binding of thread tid.*

### 11.11.1 Detailed Description

It is often useful to call `hwloc_cpuset_singlify()` first so that a single CPU remains in the set. This way, the process will not even migrate between different CPUs. Some OSes also only support that kind of binding.

#### Note

Some OSes do not provide all ways to bind processes, threads, etc and the corresponding binding functions may fail. ENOSYS is returned when it is not possible to bind the requested kind of object (processes/threads). EXDEV is returned when the requested cpuset can not be enforced (e.g. some systems only allow one CPU, and some other systems only allow one NUMA node)

The most portable version that should be preferred over the others, whenever possible, is

```
hwloc_set_cpubind(topology, set, 0),
```

as it just binds the current program, assuming it is monothread, or

```
hwloc_set_cpubind(topology, set, HWLOC_CPUBIND_THREAD),
```

which binds the current thread of the current program (which may be multithreaded).

#### Note

To unbind, just call the binding function with either a full cpuset or a cpuset equal to the system cpuset.

### 11.11.2 Enumeration Type Documentation

#### 11.11.2.1 enum `hwloc_cpubind_policy_t`

Process/Thread binding policy.

These flags can be used to refine the binding policy.

The default (0) is to bind the current process, assumed to be mono-thread, in a non-strict way. This is the most portable way to bind as all OSes usually provide it.

**Enumerator:**

***HWLOC\_CPUBIND\_PROCESS*** Bind all threads of the current multithreaded process. This may not be supported by some OSes.

***HWLOC\_CPUBIND\_THREAD*** Bind current thread of current process.

***HWLOC\_CPUBIND\_STRICT*** Request for strict binding from the OS. By default, when the designated CPUs are all busy while other CPUs are idle, OSes may execute the thread/process on those other CPUs instead of the designated CPUs, to let them progress anyway. Strict binding means that the thread/process will *never* execute on other cpus than the designated CPUs, even when those are busy with other tasks and other CPUs are idle.

**Note**

Depending on OSes and implementations, strict binding may not be possible (implementation reason) or not allowed (administrative reasons), and the function will fail in that case.

When retrieving the binding of a process, this flag checks whether all its threads actually have the same binding. If the flag is not given, the binding of each thread will be accumulated.

**Note**

This flag is meaningless when retrieving the binding of a thread.

### 11.11.3 Function Documentation

#### 11.11.3.1 HWLOC\_DECLSPEC int hwloc\_get\_cpubind ( *hwloc\_topology\_t topology*, *hwloc\_cpuset\_t set*, *int policy* )

Get current process or thread binding.

#### 11.11.3.2 HWLOC\_DECLSPEC int hwloc\_get\_proc\_cpudbind ( *hwloc\_topology\_t topology*, *hwloc\_pid\_t pid*, *hwloc\_cpuset\_t set*, *int policy* )

Get the current binding of process *pid*.

**Note**

*hwloc\_pid\_t* is *pid\_t* on unix platforms, and *HANDLE* on native Windows platforms

*HWLOC\_CPUBIND\_THREAD* can not be used in *policy*.

**11.11.3.3 HWLOC\_DECLSPEC int hwloc\_get\_thread\_cpubind (**  
**hwloc\_topology\_t *topology*, hwloc\_thread\_t *tid*, hwloc\_cpuset\_t *set*,**  
**int *policy* )**

Get the current binding of thread *tid*.

**Note**

hwloc\_thread\_t is pthread\_t on unix platforms, and HANDLE on native Windows platforms  
HWLOC\_CPUBIND\_PROCESS can not be used in *policy*.

**11.11.3.4 HWLOC\_DECLSPEC int hwloc\_set\_cpubind ( hwloc\_topology\_t**  
***topology*, hwloc\_const\_cpuset\_t *set*, int *policy* )**

Bind current process or thread on cpus given in cpuset *set*.

**Returns**

ENOSYS if the action is not supported  
EXDEV if the binding cannot be enforced

**11.11.3.5 HWLOC\_DECLSPEC int hwloc\_set\_proc\_cpubind (**  
**hwloc\_topology\_t *topology*, hwloc\_pid\_t *pid*, hwloc\_const\_cpuset\_t**  
***set*, int *policy* )**

Bind a process *pid* on cpus given in cpuset *set*.

**Note**

hwloc\_pid\_t is pid\_t on unix platforms, and HANDLE on native Windows platforms  
HWLOC\_CPUBIND\_THREAD can not be used in *policy*.

**11.11.3.6 HWLOC\_DECLSPEC int hwloc\_set\_thread\_cpubind**  
**( hwloc\_topology\_t *topology*, hwloc\_thread\_t *tid*,**  
**hwloc\_const\_cpuset\_t *set*, int *policy* )**

Bind a thread *tid* on cpus given in cpuset *set*.

**Note**

hwloc\_thread\_t is pthread\_t on unix platforms, and HANDLE on native Windows platforms  
HWLOC\_CPUBIND\_PROCESS can not be used in *policy*.

## 11.12 Object Type Helpers

### Functions

- static \_\_hwloc\_inline int \_\_hwloc\_attribute\_pure **hwloc\_get\_type\_or\_below\_depth** (**hwloc\_topology\_t** topology, **hwloc\_obj\_type\_t** type)
 

*Returns the depth of objects of type type or below.*
- static \_\_hwloc\_inline int \_\_hwloc\_attribute\_pure **hwloc\_get\_type\_or\_above\_depth** (**hwloc\_topology\_t** topology, **hwloc\_obj\_type\_t** type)
 

*Returns the depth of objects of type type or above.*

### 11.12.1 Function Documentation

**11.12.1.1 static \_\_hwloc\_inline int \_\_hwloc\_attribute\_pure  
hwloc\_get\_type\_or\_above\_depth ( hwloc\_topology\_t topology,  
hwloc\_obj\_type\_t type ) [static]**

Returns the depth of objects of type type or above.

If no object of this type is present on the underlying architecture, the function returns the depth of the first "present" object typically containing type.

**11.12.1.2 static \_\_hwloc\_inline int \_\_hwloc\_attribute\_pure  
hwloc\_get\_type\_or\_below\_depth ( hwloc\_topology\_t topology,  
hwloc\_obj\_type\_t type ) [static]**

Returns the depth of objects of type type or below.

If no object of this type is present on the underlying architecture, the function returns the depth of the first "present" object typically found inside type.

## 11.13 Basic Traversal Helpers

### Functions

- static \_\_hwloc\_inline **hwloc\_obj\_t** \_\_hwloc\_attribute\_pure **hwloc\_get\_root\_obj** (**hwloc\_topology\_t** topology)
 

*Returns the top-object of the topology-tree.*

- static \_\_hwloc\_inline hwloc\_obj\_t \_\_hwloc\_attribute\_pure hwloc\_get\_ancestor\_obj\_by\_depth (hwloc\_topology\_t topology \_\_hwloc\_attribute\_unused, unsigned depth, hwloc\_obj\_t obj)

*Returns the ancestor object of obj at depth depth.*

- static \_\_hwloc\_inline hwloc\_obj\_t \_\_hwloc\_attribute\_pure hwloc\_get\_ancestor\_obj\_by\_type (hwloc\_topology\_t topology \_\_hwloc\_attribute\_unused, hwloc\_obj\_type\_t type, hwloc\_obj\_t obj)

*Returns the ancestor object of obj with type type.*

- static \_\_hwloc\_inline hwloc\_obj\_t hwloc\_get\_next\_obj\_by\_depth (hwloc\_topology\_t topology, unsigned depth, hwloc\_obj\_t prev)

*Returns the next object at depth depth.*

- static \_\_hwloc\_inline hwloc\_obj\_t hwloc\_get\_next\_obj\_by\_type (hwloc\_topology\_t topology, hwloc\_obj\_type\_t type, hwloc\_obj\_t prev)

*Returns the next object of type type.*

- static \_\_hwloc\_inline hwloc\_obj\_t \_\_hwloc\_attribute\_pure hwloc\_get\_pu\_obj\_by\_os\_index (hwloc\_topology\_t topology, unsigned os\_index)

*Returns the object of type HWLOC\_OBJ\_PU with os\_index.*

- static \_\_hwloc\_inline hwloc\_obj\_t hwloc\_get\_next\_child (hwloc\_topology\_t topology \_\_hwloc\_attribute\_unused, hwloc\_obj\_t parent, hwloc\_obj\_t prev)

*Return the next child.*

- static \_\_hwloc\_inline hwloc\_obj\_t \_\_hwloc\_attribute\_pure hwloc\_get\_common\_ancestor\_obj (hwloc\_topology\_t topology \_\_hwloc\_attribute\_unused, hwloc\_obj\_t obj1, hwloc\_obj\_t obj2)

*Returns the common parent object to objects lvl1 and lvl2.*

- static \_\_hwloc\_inline int \_\_hwloc\_attribute\_pure hwloc\_obj\_is\_in\_subtree (hwloc\_topology\_t topology \_\_hwloc\_attribute\_unused, hwloc\_obj\_t obj, hwloc\_obj\_t subtree\_root)

*Returns true if \_obj\_ is inside the subtree beginning with subtree\_root.*

### 11.13.1 Function Documentation

**11.13.1.1 static \_\_hwloc\_inline hwloc\_obj\_t \_\_hwloc\_attribute\_pure  
 hwloc\_get\_ancestor\_obj\_by\_depth ( hwloc\_topology\_t topology  
 \_\_hwloc\_attribute\_unused, unsigned depth, hwloc\_obj\_t obj )  
 [static]**

Returns the ancestor object of `obj` at depth `depth`.

**11.13.1.2 static \_\_hwloc\_inline hwloc\_obj\_t \_\_hwloc\_attribute\_pure  
 hwloc\_get\_ancestor\_obj\_by\_type ( hwloc\_topology\_t topology  
 \_\_hwloc\_attribute\_unused, hwloc\_obj\_type\_t type, hwloc\_obj\_t obj  
 ) [static]**

Returns the ancestor object of `obj` with type `type`.

**11.13.1.3 static \_\_hwloc\_inline hwloc\_obj\_t \_\_hwloc\_attribute\_pure  
 hwloc\_get\_common\_ancestor\_obj ( hwloc\_topology\_t topology  
 \_\_hwloc\_attribute\_unused, hwloc\_obj\_t obj1, hwloc\_obj\_t obj2 )  
 [static]**

Returns the common parent object to objects `lvl1` and `lvl2`.

**11.13.1.4 static \_\_hwloc\_inline hwloc\_obj\_t hwloc\_get\_next\_child ( hwloc\_topology\_t topology \_\_hwloc\_attribute\_unused, hwloc\_obj\_t parent, hwloc\_obj\_t prev ) [static]**

Return the next child.

If `prev` is NULL, return the first child.

**11.13.1.5 static \_\_hwloc\_inline hwloc\_obj\_t hwloc\_get\_next\_obj\_by\_depth ( hwloc\_topology\_t topology, unsigned depth, hwloc\_obj\_t prev ) [static]**

Returns the next object at depth `depth`.

If `prev` is NULL, return the first object at depth `depth`.

```
11.13.1.6 static __hwloc_inline hwloc_obj_t hwloc_get_next_obj_by_type (
    hwloc_topology_t topology, hwloc_obj_type_t type, hwloc_obj_t
    prev ) [static]
```

Returns the next object of type `type`.

If `prev` is NULL, return the first object at type `type`. If there are multiple or no depth for given type, return NULL and let the caller fallback to [hwloc\\_get\\_next\\_obj\\_by\\_depth\(\)](#).

```
11.13.1.7 static __hwloc_inline hwloc_obj_t __hwloc_attribute_pure
    hwloc_get_pu_obj_by_os_index ( hwloc_topology_t topology,
    unsigned os_index ) [static]
```

Returns the object of type [HWLOC\\_OBJ\\_PU](#) with `os_index`.

#### Note

The `os_index` field of object should most of the times only be used for pretty-printing purpose. Type [HWLOC\\_OBJ\\_PU](#) is the only case where `os_index` could actually be useful, when manually binding to processors. However, using CPU sets to hide this complexity should often be preferred.

```
11.13.1.8 static __hwloc_inline hwloc_obj_t __hwloc_attribute_pure
    hwloc_get_root_obj ( hwloc_topology_t topology ) [static]
```

Returns the top-object of the topology-tree.

Its type is typically [HWLOC\\_OBJ\\_MACHINE](#) but it could be different for complex topologies. This function replaces the old deprecated `hwloc_get_system_obj()`.

```
11.13.1.9 static __hwloc_inline int __hwloc_attribute_pure
    hwloc_obj_is_in_subtree ( hwloc_topology_t topology
    __hwloc_attribute_unused, hwloc_obj_t obj, hwloc_obj_t
    subtree_root ) [static]
```

Returns true if `_obj_` is inside the subtree beginning with `subtree_root`.

## 11.14 Finding Objects Inside a CPU set

### Functions

- static \_\_hwloc\_inline `hwloc_obj_t hwloc_get_first_largest_obj_inside_cpuset (hwloc_topology_t topology, hwloc_const_cpuset_t set)`  
*Get the first largest object included in the given cpuset set.*
- HWLOC\_DECLSPEC int `hwloc_get_largest_objs_inside_cpuset (hwloc_topology_t topology, hwloc_const_cpuset_t set, hwloc_obj_t *__hwloc_restrict objs, int max)`  
*Get the set of largest objects covering exactly a given cpuset set.*
- static \_\_hwloc\_inline `hwloc_obj_t hwloc_get_next_obj_inside_cpuset_by_depth (hwloc_topology_t topology, hwloc_const_cpuset_t set, unsigned depth, hwloc_obj_t prev)`  
*Return the next object at depth depth included in CPU set set.*
- static \_\_hwloc\_inline `hwloc_obj_t hwloc_get_next_obj_inside_cpuset_by_type (hwloc_topology_t topology, hwloc_const_cpuset_t set, hwloc_obj_type_t type, hwloc_obj_t prev)`  
*Return the next object of type type included in CPU set set.*
- static \_\_hwloc\_inline `hwloc_obj_t __hwloc_attribute_pure hwloc_get_obj_inside_cpuset_by_depth (hwloc_topology_t topology, hwloc_const_cpuset_t set, unsigned depth, unsigned idx)`  
*Return the index-th object at depth depth included in CPU set set.*
- static \_\_hwloc\_inline `hwloc_obj_t __hwloc_attribute_pure hwloc_get_obj_inside_cpuset_by_type (hwloc_topology_t topology, hwloc_const_cpuset_t set, hwloc_obj_type_t type, unsigned idx)`  
*Return the idx-th object of type type included in CPU set set.*
- static \_\_hwloc\_inline unsigned \_\_hwloc\_attribute\_pure `hwloc_get_nbobjs_inside_cpuset_by_depth (hwloc_topology_t topology, hwloc_const_cpuset_t set, unsigned depth)`  
*Return the number of objects at depth depth included in CPU set set.*
- static \_\_hwloc\_inline int \_\_hwloc\_attribute\_pure `hwloc_get_nbobjs_inside_cpuset_by_type (hwloc_topology_t topology, hwloc_const_cpuset_t set, hwloc_obj_type_t type)`  
*Return the number of objects of type type included in CPU set set.*

### 11.14.1 Function Documentation

**11.14.1.1 static \_\_hwloc\_inline hwloc\_obj\_t hwloc\_get\_first\_largest\_obj\_inside\_cpuset ( hwloc\_topology\_t topology, hwloc\_const\_cpuset\_t set ) [static]**

Get the first largest object included in the given cpuset *set*.

#### Returns

the first object that is included in *set* and whose parent is not.

This is convenient for iterating over all largest objects within a CPU set by doing a loop getting the first largest object and clearing its CPU set from the remaining CPU set.

**11.14.1.2 HWLOC\_DECLSPEC int hwloc\_get\_largest\_objs\_inside\_cpuset ( hwloc\_topology\_t topology, hwloc\_const\_cpuset\_t set, hwloc\_obj\_t \* \_\_hwloc\_restrict objs, int max )**

Get the set of largest objects covering exactly a given cpuset *set*.

#### Returns

the number of objects returned in *objs*.

**11.14.1.3 static \_\_hwloc\_inline unsigned \_\_hwloc\_attribute\_pure hwloc\_get\_nbobjs\_inside\_cpuset\_by\_depth ( hwloc\_topology\_t topology, hwloc\_const\_cpuset\_t set, unsigned depth ) [static]**

Return the number of objects at depth *depth* included in CPU set *set*.

**11.14.1.4 static \_\_hwloc\_inline int \_\_hwloc\_attribute\_pure hwloc\_get\_nbobjs\_inside\_cpuset\_by\_type ( hwloc\_topology\_t topology, hwloc\_const\_cpuset\_t set, hwloc\_obj\_type\_t type ) [static]**

Return the number of objects of type *type* included in CPU set *set*.

If no object for that type exists inside CPU set *set*, 0 is returned. If there are several levels with objects of that type inside CPU set *set*, -1 is returned.

**11.14.1.5 static \_\_hwloc\_inline hwloc\_obj\_t hwloc\_get\_next\_obj\_inside\_cpuset\_by\_depth( hwloc\_topology\_t topology, hwloc\_const\_cpuset\_t set, unsigned depth, hwloc\_obj\_t prev ) [static]**

Return the next object at depth `depth` included in CPU set `set`.

If `prev` is NULL, return the first object at depth `depth` included in `set`. The next invocation should pass the previous return value in `prev` so as to obtain the next object in `set`.

**11.14.1.6 static \_\_hwloc\_inline hwloc\_obj\_t hwloc\_get\_next\_obj\_inside\_cpuset\_by\_type( hwloc\_topology\_t topology, hwloc\_const\_cpuset\_t set, hwloc\_obj\_type\_t type, hwloc\_obj\_t prev ) [static]**

Return the next object of type `type` included in CPU set `set`.

If there are multiple or no depth for given type, return NULL and let the caller fallback to `hwloc_get_next_obj_inside_cpuset_by_depth()`.

**11.14.1.7 static \_\_hwloc\_inline hwloc\_obj\_t \_\_hwloc\_attribute\_pure hwloc\_get\_obj\_inside\_cpuset\_by\_depth( hwloc\_topology\_t topology, hwloc\_const\_cpuset\_t set, unsigned depth, unsigned idx ) [static]**

Return the `index`-th object at depth `depth` included in CPU set `set`.

**11.14.1.8 static \_\_hwloc\_inline hwloc\_obj\_t \_\_hwloc\_attribute\_pure hwloc\_get\_obj\_inside\_cpuset\_by\_type( hwloc\_topology\_t topology, hwloc\_const\_cpuset\_t set, hwloc\_obj\_type\_t type, unsigned idx ) [static]**

Return the `idx`-th object of type `type` included in CPU set `set`.

If there are multiple or no depth for given type, return NULL and let the caller fallback to `hwloc_get_obj_inside_cpuset_by_depth()`.

## 11.15 Finding a single Object covering at least CPU set

### Functions

- static \_\_hwloc\_inline hwloc\_obj\_t \_\_hwloc\_attribute\_pure [hwloc\\_get\\_child\\_covering\\_cpuset](#) (hwloc\_topology\_t topology, \_\_hwloc\_attribute\_unused, hwloc\_const\_cpuset\_t set, hwloc\_obj\_t parent)

*Get the child covering at least CPU set set.*

- static \_\_hwloc\_inline hwloc\_obj\_t \_\_hwloc\_attribute\_pure hwloc\_get\_obj\_covering\_cpuset (hwloc\_topology\_t topology, hwloc\_const\_cpuset\_t set)

*Get the lowest object covering at least CPU set set.*

## 11.15.1 Function Documentation

**11.15.1.1 static \_\_hwloc\_inline hwloc\_obj\_t \_\_hwloc\_attribute\_pure  
hwloc\_get\_child\_covering\_cpuset ( hwloc\_topology\_t topology,  
\_\_hwloc\_attribute\_unused, hwloc\_const\_cpuset\_t set, hwloc\_obj\_t  
parent ) [static]**

Get the child covering at least CPU set set.

### Returns

NULL if no child matches or if set is empty.

**11.15.1.2 static \_\_hwloc\_inline hwloc\_obj\_t \_\_hwloc\_attribute\_pure  
hwloc\_get\_obj\_covering\_cpuset ( hwloc\_topology\_t topology,  
hwloc\_const\_cpuset\_t set ) [static]**

Get the lowest object covering at least CPU set set.

### Returns

NULL if no object matches or if set is empty.

## 11.16 Finding a set of similar Objects covering at least a CPU set

### Functions

- static \_\_hwloc\_inline hwloc\_obj\_t hwloc\_get\_next\_obj\_covering\_cpuset\_by\_depth (hwloc\_topology\_t topology, hwloc\_const\_cpuset\_t set, unsigned depth, hwloc\_obj\_t prev)

*Iterate through same-depth objects covering at least CPU set set.*

- static \_\_hwloc\_inline hwloc\_obj\_t hwloc\_get\_next\_obj\_covering\_cpuset\_by\_type (hwloc\_topology\_t topology, hwloc\_const\_cpuset\_t set, hwloc\_obj\_type\_t type, hwloc\_obj\_t prev)

*Iterate through same-type objects covering at least CPU set set.*

### 11.16.1 Function Documentation

- 11.16.1.1 static \_\_hwloc\_inline hwloc\_obj\_t hwloc\_get\_next\_obj\_covering\_cpuset\_by\_depth ( hwloc\_topology\_t topology, hwloc\_const\_cpuset\_t set, unsigned depth, hwloc\_obj\_t prev ) [static]**

Iterate through same-depth objects covering at least CPU set set.

If object prev is NULL, return the first object at depth depth covering at least part of CPU set set. The next invocation should pass the previous return value in prev so as to obtain the next object covering at least another part of set.

- 11.16.1.2 static \_\_hwloc\_inline hwloc\_obj\_t hwloc\_get\_next\_obj\_covering\_cpuset\_by\_type ( hwloc\_topology\_t topology, hwloc\_const\_cpuset\_t set, hwloc\_obj\_type\_t type, hwloc\_obj\_t prev ) [static]**

Iterate through same-type objects covering at least CPU set set.

If object prev is NULL, return the first object of type type covering at least part of CPU set set. The next invocation should pass the previous return value in prev so as to obtain the next object of type type covering at least another part of set.

If there are no or multiple depths for type type, NULL is returned. The caller may fallback to [hwloc\\_get\\_next\\_obj\\_covering\\_cpuset\\_by\\_depth\(\)](#) for each depth.

## 11.17 Cache-specific Finding Helpers

### Functions

- static \_\_hwloc\_inline hwloc\_obj\_t \_\_hwloc\_attribute\_pure hwloc\_get\_cache\_covering\_cpuset (hwloc\_topology\_t topology, hwloc\_const\_cpuset\_t set)

*Get the first cache covering a cpuset set.*

- static \_\_hwloc\_inline hwloc\_obj\_t \_\_hwloc\_attribute\_pure hwloc\_get\_shared\_cache\_covering\_obj (hwloc\_topology\_t topology \_\_hwloc\_attribute\_unused, hwloc\_obj\_t obj)

*Get the first cache shared between an object and somebody else.*

### 11.17.1 Function Documentation

**11.17.1.1 static \_\_hwloc\_inline hwloc\_obj\_t \_\_hwloc\_attribute\_pure hwloc\_get\_cache\_covering\_cpuset ( hwloc\_topology\_t topology, hwloc\_const\_cpuset\_t set ) [static]**

Get the first cache covering a cpuset set.

#### Returns

NULL if no cache matches

**11.17.1.2 static \_\_hwloc\_inline hwloc\_obj\_t \_\_hwloc\_attribute\_pure hwloc\_get\_shared\_cache\_covering\_obj ( hwloc\_topology\_t topology \_\_hwloc\_attribute\_unused, hwloc\_obj\_t obj ) [static]**

Get the first cache shared between an object and somebody else.

#### Returns

NULL if no cache matches

## 11.18 Advanced Traversal Helpers

### Functions

- HWLOC\_DECLSPEC unsigned [hwloc\\_get\\_closest\\_objs](#) (hwloc\_topology\_t topology, hwloc\_obj\_t src, hwloc\_obj\_t \*\_\_hwloc\_restrict objs, unsigned max)

*Do a depth-first traversal of the topology to find and sort.*

- static \_\_hwloc\_inline hwloc\_obj\_t \_\_hwloc\_attribute\_pure [hwloc\\_get\\_obj\\_below\\_by\\_type](#) (hwloc\_topology\_t topology, hwloc\_obj\_type\_t type1, unsigned idx1, hwloc\_obj\_type\_t type2, unsigned idx2)

*Find an object below another object, both specified by types and indexes.*

- static \_\_hwloc\_inline hwloc\_obj\_t \_\_hwloc\_attribute\_pure [hwloc\\_get\\_obj\\_below\\_array\\_by\\_type](#) (hwloc\_topology\_t topology, int nr, hwloc\_obj\_type\_t \*typev, unsigned \*idrv)

*Find an object below a chain of objects specified by types and indexes.*

### 11.18.1 Function Documentation

**11.18.1.1 HWLOC\_DECLSPEC unsigned hwloc\_get\_closest\_objs ( hwloc\_topology\_t topology, hwloc\_obj\_t src, hwloc\_obj\_t \*hwloc\_restrict objs, unsigned max )**

Do a depth-first traversal of the topology to find and sort.

all objects that are at the same depth than `src`. Report in `objs` up to `max` physically closest ones to `src`.

#### Returns

the number of objects returned in `objs`.

**11.18.1.2 static \_\_hwloc\_inline hwloc\_obj\_t \_\_hwloc\_attribute\_pure hwloc\_get\_obj\_below\_array\_by\_type ( hwloc\_topology\_t topology, int nr, hwloc\_obj\_type\_t \* typev, unsigned \* idxv ) [static]**

Find an object below a chain of objects specified by types and indexes.

This is a generalized version of [hwloc\\_get\\_obj\\_below\\_by\\_type\(\)](#).

Arrays `typev` and `idxv` must contain `nr` types and indexes.

Start from the top system object and walk the arrays `typev` and `idxv`. For each type and index couple in the arrays, look under the previously found object to find the index-th object of the given type. Indexes are specified within the parent, not withing the entire system.

For instance, if `nr` is 3, `typev` contains NODE, SOCKET and CORE, and `idxv` contains 0, 1 and 2, return the third core object below the second socket below the first NUMA node.

**11.18.1.3 static \_\_hwloc\_inline hwloc\_obj\_t \_\_hwloc\_attribute\_pure hwloc\_get\_obj\_below\_by\_type ( hwloc\_topology\_t topology, hwloc\_obj\_type\_t type1, unsigned idx1, hwloc\_obj\_type\_t type2, unsigned idx2 ) [static]**

Find an object below another object, both specified by types and indexes.

Start from the top system object and find object of type `type1` and index `idx1`. Then look below this object and find another object of type `type2` and index `idx2`. Indexes are specified within the parent, not withing the entire system.

For instance, if `type1` is SOCKET, `idx1` is 2, `type2` is CORE and `idx2` is 3, return the fourth core object below the third socket.

## 11.19 Binding Helpers

### Functions

- static \_\_hwloc\_inline void `hwloc_distribute` (`hwloc_topology_t` topology, `hwloc_obj_t` root, `hwloc_cpuset_t` \*cpuset, unsigned n)

*Distribute n items over the topology under root.*

### 11.19.1 Function Documentation

**11.19.1.1 static \_\_hwloc\_inline void `hwloc_distribute` ( `hwloc_topology_t` topology, `hwloc_obj_t` root, `hwloc_cpuset_t` \* cpuset, unsigned n ) [static]**

Distribute n items over the topology under root.

Array cpuset will be filled with n cpusets distributed linearly over the topology under root .

This is typically useful when an application wants to distribute n threads over a machine, giving each of them as much private cache as possible and keeping them locally in number order.

The caller may typically want to also call `hwloc_cpuset_singlify()` before binding a thread so that it does not move at all.

## 11.20 Cpuset Helpers

### Functions

- static \_\_hwloc\_inline `hwloc_const_cpuset_t` \_\_hwloc\_attribute\_pure `hwloc_topology_get_complete_cpuset` (`hwloc_topology_t` topology)
- static \_\_hwloc\_inline `hwloc_const_cpuset_t` \_\_hwloc\_attribute\_pure `hwloc_topology_get_topology_cpuset` (`hwloc_topology_t` topology)
- static \_\_hwloc\_inline `hwloc_const_cpuset_t` \_\_hwloc\_attribute\_pure `hwloc_topology_get_online_cpuset` (`hwloc_topology_t` topology)

*Get online CPU set.*

- static \_\_hwloc\_inline `hwloc_const_cpuset_t` \_\_hwloc\_attribute\_pure `hwloc_topology_get_allowed_cpuset` (`hwloc_topology_t` topology)

*Get allowed CPU set.*

### 11.20.1 Function Documentation

```
11.20.1.1 static __hwloc_inline hwloc_const_cpuset_t __hwloc_attribute_pure
           hwloc_topology_get_allowed_cpuset ( hwloc_topology_t topology )
           [static]
```

Get allowed CPU set.

#### Returns

the CPU set of allowed logical processors of the system. If the topology is the result of a combination of several systems, NULL is returned.

#### Note

The returned cpuset is not newly allocated and should thus not be changed or freed, hwloc\_cpuset\_dup must be used to obtain a local copy.

```
11.20.1.2 static __hwloc_inline hwloc_const_cpuset_t __hwloc_attribute_pure
           hwloc_topology_get_complete_cpuset ( hwloc_topology_t topology )
           [static]
```

```
11.20.1.3 static __hwloc_inline hwloc_const_cpuset_t __hwloc_attribute_pure
           hwloc_topology_get_online_cpuset ( hwloc_topology_t topology )
           [static]
```

Get online CPU set.

#### Returns

the CPU set of online logical processors of the system. If the topology is the result of a combination of several systems, NULL is returned.

#### Note

The returned cpuset is not newly allocated and should thus not be changed or freed; hwloc\_cpuset\_dup must be used to obtain a local copy.

---

**11.20.1.4 static \_\_hwloc\_inline hwloc\_const\_cpuset\_t \_\_hwloc\_attribute\_pure  
hwloc\_topology\_get\_topology\_cpuset ( hwloc\_topology\_t topology )  
[static]**

## 11.21 The Cpuset API

### Defines

- #define **hwloc\_cpuset\_FOREACH\_BEGIN**(cpu, set)  
*Loop macro iterating on CPU set set.*
- #define **hwloc\_cpuset\_FOREACH\_END()**  
*End of loop. Needs a terminating ';*.

### Typedefs

- typedef struct hwloc\_cpuset\_s \* **hwloc\_cpuset\_t**  
*Set of CPUs represented as an opaque pointer to an internal bitmask.*
- typedef struct hwloc\_cpuset\_s \* **hwloc\_const\_cpuset\_t**

### Functions

- HWLOC\_DECLARESPEC **hwloc\_cpuset\_t hwloc\_cpuset\_alloc** (void) **\_\_hwloc\_attribute\_malloc**  
*Allocate a new empty CPU set.*
- HWLOC\_DECLARESPEC void **hwloc\_cpuset\_free** (**hwloc\_cpuset\_t** set)  
*Free CPU set set.*
- HWLOC\_DECLARESPEC **hwloc\_cpuset\_t hwloc\_cpuset\_dup** (**hwloc\_const\_cpuset\_t** set) **\_\_hwloc\_attribute\_malloc**  
*Duplicate CPU set set by allocating a new CPU set and copying set's contents.*
- HWLOC\_DECLARESPEC void **hwloc\_cpuset\_copy** (**hwloc\_cpuset\_t** dst, **hwloc\_const\_cpuset\_t** src)  
*Copy the contents of CPU set src into the already allocated CPU set dst.*
- HWLOC\_DECLARESPEC int **hwloc\_cpuset\_snprintf** (char \***\_\_hwloc\_restrict** buf, size\_t buflen, **hwloc\_const\_cpuset\_t** set)  
*Stringify a cpuset.*

- HWLOC\_DECLSPEC int `hwloc_cpuset_asprintf` (char \*\*`strp`, `hwloc_const_cpuset_t` `set`)
 

*Stringify a cpuset into a newly allocated string.*
- HWLOC\_DECLSPEC int `hwloc_cpuset_from_string` (`hwloc_cpuset_t` `set`, const char \*`_hwloc_restrict` string)
 

*Parse a cpuset string and stores it in CPU set set.*
- HWLOC\_DECLSPEC void `hwloc_cpuset_zero` (`hwloc_cpuset_t` `set`)
 

*Empty the CPU set set.*
- HWLOC\_DECLSPEC void `hwloc_cpuset_fill` (`hwloc_cpuset_t` `set`)
 

*Fill CPU set set with all possible CPUs (even if those CPUs don't exist or are otherwise unavailable).*
- HWLOC\_DECLSPEC void `hwloc_cpuset_from_ulong` (`hwloc_cpuset_t` `set`, unsigned long mask)
 

*Setup CPU set set from unsigned long mask.*
- HWLOC\_DECLSPEC void `hwloc_cpuset_from_ith_ulong` (`hwloc_cpuset_t` `set`, unsigned i, unsigned long mask)
 

*Setup CPU set set from unsigned long mask used as i -th subset.*
- HWLOC\_DECLSPEC unsigned long `hwloc_cpuset_to_ulong` (`hwloc_const_cpuset_t` `set`) `_hwloc_attribute_pure`

*Convert the beginning part of CPU set set into unsigned long mask.*
- HWLOC\_DECLSPEC unsigned long `hwloc_cpuset_to_ith_ulong` (`hwloc_const_cpuset_t` `set`, unsigned i) `_hwloc_attribute_pure`

*Convert the i -th subset of CPU set set into unsigned long mask.*
- HWLOC\_DECLSPEC void `hwloc_cpuset_cpu` (`hwloc_cpuset_t` `set`, unsigned `cpu`)
 

*Empty the CPU set set and add CPU cpu.*
- HWLOC\_DECLSPEC void `hwloc_cpuset_all_but_cpu` (`hwloc_cpuset_t` `set`, unsigned `cpu`)
 

*Empty the CPU set set and add all but the CPU cpu.*
- HWLOC\_DECLSPEC void `hwloc_cpuset_set` (`hwloc_cpuset_t` `set`, unsigned `cpu`)
 

*Add CPU cpu in CPU set set.*

- HWLOC\_DECLARESPEC void `hwloc_cpuset_set_range` (`hwloc_cpuset_t` set, unsigned begincpu, unsigned endcpu)
 

*Add CPUs from begincpu to endcpu in CPU set set.*
- HWLOC\_DECLARESPEC void `hwloc_cpuset_clr` (`hwloc_cpuset_t` set, unsigned cpu)
 

*Remove CPU cpu from CPU set set.*
- HWLOC\_DECLARESPEC void `hwloc_cpuset_clr_range` (`hwloc_cpuset_t` set, unsigned begincpu, unsigned endcpu)
 

*Remove CPUs from begincpu to endcpu in CPU set set.*
- HWLOC\_DECLARESPEC int `hwloc_cpuset_isset` (`hwloc_const_cpuset_t` set, unsigned cpu) `__hwloc_attribute_pure`

*Test whether CPU cpu is part of set set.*
- HWLOC\_DECLARESPEC int `hwloc_cpuset_iszero` (`hwloc_const_cpuset_t` set) `__hwloc_attribute_pure`

*Test whether set set is empty.*
- HWLOC\_DECLARESPEC int `hwloc_cpuset_isfull` (`hwloc_const_cpuset_t` set) `__hwloc_attribute_pure`

*Test whether set set is completely full.*
- HWLOC\_DECLARESPEC int `hwloc_cpuset_isequal` (`hwloc_const_cpuset_t` set1, `hwloc_const_cpuset_t` set2) `__hwloc_attribute_pure`

*Test whether set set1 is equal to set set2.*
- HWLOC\_DECLARESPEC int `hwloc_cpuset_intersects` (`hwloc_const_cpuset_t` set1, `hwloc_const_cpuset_t` set2) `__hwloc_attribute_pure`

*Test whether sets set1 and set2 intersects.*
- HWLOC\_DECLARESPEC int `hwloc_cpuset_isincluded` (`hwloc_const_cpuset_t` sub\_set, `hwloc_const_cpuset_t` super\_set) `__hwloc_attribute_pure`

*Test whether set sub\_set is part of set super\_set.*
- HWLOC\_DECLARESPEC void `hwloc_cpuset_or` (`hwloc_cpuset_t` res, `hwloc_const_cpuset_t` set1, `hwloc_const_cpuset_t` set2)
 

*Or sets set1 and set2 and store the result in set res.*
- HWLOC\_DECLARESPEC void `hwloc_cpuset_and` (`hwloc_cpuset_t` res, `hwloc_const_cpuset_t` set1, `hwloc_const_cpuset_t` set2)

*And sets set1 and set2 and store the result in set res.*

- HWLOC\_DECLARESPEC void `hwloc_cpuset_andnot` (`hwloc_cpuset_t` res, `hwloc_const_cpuset_t` set1, `hwloc_const_cpuset_t` set2)

*And set set1 and the negation of set2 and store the result in set res.*

- HWLOC\_DECLARESPEC void `hwloc_cpuset_xor` (`hwloc_cpuset_t` res, `hwloc_const_cpuset_t` set1, `hwloc_const_cpuset_t` set2)

*Xor sets set1 and set2 and store the result in set res.*

- HWLOC\_DECLARESPEC void `hwloc_cpuset_not` (`hwloc_cpuset_t` res, `hwloc_const_cpuset_t` set)

*Negate set set and store the result in set res.*

- HWLOC\_DECLARESPEC int `hwloc_cpuset_first` (`hwloc_const_cpuset_t` set) \_\_-  
`hwloc_attribute_pure`

*Compute the first CPU (least significant bit) in CPU set set.*

- HWLOC\_DECLARESPEC int `hwloc_cpuset_last` (`hwloc_const_cpuset_t` set) \_\_-  
`hwloc_attribute_pure`

*Compute the last CPU (most significant bit) in CPU set set.*

- HWLOC\_DECLARESPEC int `hwloc_cpuset_next` (`hwloc_const_cpuset_t` set, un-  
signed prev\_cpu) \_\_`hwloc_attribute_pure`

*Compute the next CPU in CPU set set which is after CPU prev\_cpu.*

- HWLOC\_DECLARESPEC void `hwloc_cpuset_singlify` (`hwloc_cpuset_t` set)

*Keep a single CPU among those set in CPU set set.*

- HWLOC\_DECLARESPEC int `hwloc_cpuset_compare_first` (`hwloc_const_cpuset_t` set1, `hwloc_const_cpuset_t` set2) \_\_`hwloc_attribute_pure`

*Compare CPU sets set1 and set2 using their lowest index CPU.*

- HWLOC\_DECLARESPEC int `hwloc_cpuset_compare` (`hwloc_const_cpuset_t` set1, `hwloc_const_cpuset_t` set2) \_\_`hwloc_attribute_pure`

*Compare CPU sets set1 and set2 using their highest index CPU.*

- HWLOC\_DECLARESPEC int `hwloc_cpuset_weight` (`hwloc_const_cpuset_t` set) \_\_-  
`hwloc_attribute_pure`

*Compute the "weight" of CPU set set (i.e., number of CPUs that are in the set).*

### 11.21.1 Detailed Description

For use in hwloc itself, a `hwloc_cpuset_t` represents a set of logical processors.

#### Note

cpusets are indexed by OS logical processor physical number.

### 11.21.2 Define Documentation

#### 11.21.2.1 `#define hwloc_cpuset_FOREACH_BEGIN( cpu, set )`

Loop macro iterating on CPU set `set`.

`cpu` is the loop variable; it should be an unsigned int. The first iteration will set `cpu` to the lowest index CPU in the set. Successive iterations will iterate through, in order, all remaining CPUs that in the set. To be specific: each iteration will return a value for `cpu` such that `hwloc_cpuset_isset(set, cpu)` is true.

#### 11.21.2.2 `#define hwloc_cpuset_FOREACH_END( )`

End of loop. Needs a terminating `'.'`.

#### See also

[hwloc\\_cpuset\\_FOREACH\\_BEGIN](#)

### 11.21.3 Typedef Documentation

#### 11.21.3.1 `typedef struct hwloc_cpuset_s* hwloc_const_cpuset_t`

#### 11.21.3.2 `typedef struct hwloc_cpuset_s* hwloc_cpuset_t`

Set of CPUs represented as an opaque pointer to an internal bitmask.

### 11.21.4 Function Documentation

#### 11.21.4.1 `HWLOC_DECLSPEC void hwloc_cpuset_all_but_cpu( hwloc_cpuset_t set, unsigned cpu )`

Empty the CPU set `set` and add all but the CPU `cpu`.

**11.21.4.2 HWLOC\_DECLSPEC `hwloc_cpuset_t` `hwloc_cpuset_alloc` ( `void` )**

Allocate a new empty CPU set.

**Returns**

A valid CPU set or NULL.

The CPU set should be freed by a corresponding call to [hwloc\\_cpuset\\_free\(\)](#).

**11.21.4.3 HWLOC\_DECLSPEC `void` `hwloc_cpuset_and` ( `hwloc_cpuset_t res,`  
`hwloc_const_cpuset_t set1, hwloc_const_cpuset_t set2` )**

And sets `set1` and `set2` and store the result in set `res`.

**11.21.4.4 HWLOC\_DECLSPEC `void` `hwloc_cpuset_andnot` ( `hwloc_cpuset_t`  
`res, hwloc_const_cpuset_t set1, hwloc_const_cpuset_t set2` )**

And set `set1` and the negation of `set2` and store the result in set `res`.

**11.21.4.5 HWLOC\_DECLSPEC `int` `hwloc_cpuset_asprintf` ( `char ** strp,`  
`hwloc_const_cpuset_t set` )**

Stringify a cpuset into a newly allocated string.

**Returns**

the number of character that were actually written (not including the ending \0).

**11.21.4.6 HWLOC\_DECLSPEC `void` `hwloc_cpuset_clr` ( `hwloc_cpuset_t set,`  
`unsigned cpu` )**

Remove CPU `cpu` from CPU set `set`.

**11.21.4.7 HWLOC\_DECLSPEC `void` `hwloc_cpuset_clr_range` ( `hwloc_cpuset_t set,`  
`unsigned begincpu, unsigned endcpu` )**

Remove CPUs from `begincpu` to `endcpu` in CPU set `set`.

**11.21.4.8 HWLOC\_DECLSPEC int hwloc\_cpuset\_compare (**  
**hwloc\_const\_cpuset\_t set1, hwloc\_const\_cpuset\_t set2 )**

Compare CPU sets *set1* and *set2* using their highest index CPU.

Higher most significant bit is higher. The empty CPU set is considered lower than anything.

**11.21.4.9 HWLOC\_DECLSPEC int hwloc\_cpuset\_compare\_first (**  
**hwloc\_const\_cpuset\_t set1, hwloc\_const\_cpuset\_t set2 )**

Compare CPU sets *set1* and *set2* using their lowest index CPU.

Smaller least significant bit is smaller. The empty CPU set is considered higher than anything.

**11.21.4.10 HWLOC\_DECLSPEC void hwloc\_cpuset\_copy ( hwloc\_cpuset\_t**  
**dst, hwloc\_const\_cpuset\_t src )**

Copy the contents of CPU set *src* into the already allocated CPU set *dst*.

**11.21.4.11 HWLOC\_DECLSPEC void hwloc\_cpuset\_cpu ( hwloc\_cpuset\_t**  
**set, unsigned cpu )**

Empty the CPU set *set* and add CPU *cpu*.

**11.21.4.12 HWLOC\_DECLSPEC hwloc\_cpuset\_t hwloc\_cpuset\_dup (**  
**hwloc\_const\_cpuset\_t set )**

Duplicate CPU set *set* by allocating a new CPU set and copying *set*'s contents.

**11.21.4.13 HWLOC\_DECLSPEC void hwloc\_cpuset\_fill ( hwloc\_cpuset\_t set**  
**)**

Fill CPU set *set* with all possible CPUs (even if those CPUs don't exist or are otherwise unavailable).

**11.21.4.14 HWLOC\_DECLSPEC int hwloc\_cpuset\_first (**  
**hwloc\_const\_cpuset\_t set )**

Compute the first CPU (least significant bit) in CPU set *set*.

**Returns**

-1 if no CPU is set.

**11.21.4.15 HWLOC\_DECLSPEC void hwloc\_cpuset\_free ( hwloc\_cpuset\_t *set* )**

Free CPU set *set*.

**11.21.4.16 HWLOC\_DECLSPEC void hwloc\_cpuset\_from\_ith\_ulong ( hwloc\_cpuset\_t *set*, unsigned *i*, unsigned long *mask* )**

Setup CPU set *set* from unsigned long *mask* used as *i*-th subset.

**11.21.4.17 HWLOC\_DECLSPEC int hwloc\_cpuset\_from\_string ( hwloc\_cpuset\_t *set*, const char \*\_\_hwloc\_restrict *string* )**

Parse a cpuset string and stores it in CPU set *set*.

Must start and end with a digit.

**11.21.4.18 HWLOC\_DECLSPEC void hwloc\_cpuset\_from\_ulong ( hwloc\_cpuset\_t *set*, unsigned long *mask* )**

Setup CPU set *set* from unsigned long *mask*.

**11.21.4.19 HWLOC\_DECLSPEC int hwloc\_cpuset\_intersects ( hwloc\_const\_cpuset\_t *set1*, hwloc\_const\_cpuset\_t *set2* )**

Test whether sets *set1* and *set2* intersects.

**11.21.4.20 HWLOC\_DECLSPEC int hwloc\_cpuset\_isequal ( hwloc\_const\_cpuset\_t *set1*, hwloc\_const\_cpuset\_t *set2* )**

Test whether set *set1* is equal to set *set2*.

**11.21.4.21 HWLOC\_DECLSPEC int hwloc\_cpuset\_isfull ( hwloc\_const\_cpuset\_t *set* )**

Test whether set *set* is completely full.

**11.21.4.22 HWLOC\_DECLSPEC int hwloc\_cpuset\_isincluded (**  
**hwloc\_const\_cpuset\_t sub\_set, hwloc\_const\_cpuset\_t super\_set )**

Test whether set `sub_set` is part of set `super_set`.

**11.21.4.23 HWLOC\_DECLSPEC int hwloc\_cpuset\_isset (**  
**hwloc\_const\_cpuset\_t set, unsigned cpu )**

Test whether CPU `cpu` is part of set `set`.

**11.21.4.24 HWLOC\_DECLSPEC int hwloc\_cpuset\_iszero (**  
**hwloc\_const\_cpuset\_t set )**

Test whether set `set` is empty.

**11.21.4.25 HWLOC\_DECLSPEC int hwloc\_cpuset\_last (**  
**hwloc\_const\_cpuset\_t set )**

Compute the last CPU (most significant bit) in CPU set `set`.

#### Returns

-1 if no CPU is set.

**11.21.4.26 HWLOC\_DECLSPEC int hwloc\_cpuset\_next (**  
**hwloc\_const\_cpuset\_t set, unsigned prev\_cpu )**

Compute the next CPU in CPU set `set` which is after CPU `prev_cpu`.

#### Returns

-1 if no CPU with higher index is set.

**11.21.4.27 HWLOC\_DECLSPEC void hwloc\_cpuset\_not (**  
**hwloc\_cpuset\_t res, hwloc\_const\_cpuset\_t set )**

Negate set `set` and store the result in set `res`.

**11.21.4.28 HWLOC\_DECLSPEC void hwloc\_cpuset\_or (**  
**hwloc\_cpuset\_t res, hwloc\_const\_cpuset\_t set1, hwloc\_const\_cpuset\_t set2 )**

Or sets `set1` and `set2` and store the result in set `res`.

---

**11.21.4.29 HWLOC\_DECLSPEC void hwloc\_cpuset\_set ( hwloc\_cpuset\_t *set*,  
                  unsigned *cpu* )**

Add CPU *cpu* in CPU set *set*.

**11.21.4.30 HWLOC\_DECLSPEC void hwloc\_cpuset\_set\_range (**  
**hwloc\_cpuset\_t *set*, unsigned *begincpu*, unsigned *endcpu* )**

Add CPUs from *begincpu* to *endcpu* in CPU set *set*.

**11.21.4.31 HWLOC\_DECLSPEC void hwloc\_cpuset\_singlify ( hwloc\_cpuset\_t  
                  *set* )**

Keep a single CPU among those set in CPU set *set*.

May be useful before binding so that the process does not have a chance of migrating between multiple logical CPUs in the original mask.

**11.21.4.32 HWLOC\_DECLSPEC int hwloc\_cpuset\_snprintf ( char  
                  \*hwloc\_restrict *buf*, size\_t *buflen*, hwloc\_const\_cpuset\_t *set* )**

Stringify a cpuset.

Up to *buflen* characters may be written in buffer *buf*.

#### Returns

the number of character that were actually written if not truncating, or that would have been written (not including the ending \0).

**11.21.4.33 HWLOC\_DECLSPEC unsigned long hwloc\_cpuset\_to\_i\_th\_ulong (**  
**hwloc\_const\_cpuset\_t *set*, unsigned *i* )**

Convert the *i*-th subset of CPU set *set* into unsigned long mask.

**11.21.4.34 HWLOC\_DECLSPEC unsigned long hwloc\_cpuset\_to\_ulong (**  
**hwloc\_const\_cpuset\_t *set* )**

Convert the beginning part of CPU set *set* into unsigned long mask.

---

**11.21.4.35 HWLOC\_DECLSPEC int hwloc\_cpuset\_weight ( hwloc\_const\_cpuset\_t set )**

Compute the "weight" of CPU set *set* (i.e., number of CPUs that are in the set).

**Returns**

the number of CPUs that are in the set.

**11.21.4.36 HWLOC\_DECLSPEC void hwloc\_cpuset\_xor ( hwloc\_cpuset\_t res, hwloc\_const\_cpuset\_t set1, hwloc\_const\_cpuset\_t set2 )**

Xor sets *set1* and *set2* and store the result in set *res*.

**11.21.4.37 HWLOC\_DECLSPEC void hwloc\_cpuset\_zero ( hwloc\_cpuset\_t set )**

Empty the CPU set *set*.

## 11.22 Helpers for manipulating glibc sched affinity

### Functions

- static \_\_hwloc\_inline int [hwloc\\_cpuset\\_to\\_glibc\\_sched\\_affinity](#) (hwloc\_topology\_t topology \_\_hwloc\_attribute\_unused, hwloc\_const\_cpuset\_t hwlocset, cpu\_set\_t \*schedset, size\_t schedsetsize)
 

*Convert hwloc CPU set to poset into glibc sched affinity CPU set schedset.*
- static \_\_hwloc\_inline int [hwloc\\_cpuset\\_from\\_glibc\\_sched\\_affinity](#) (hwloc\_topology\_t topology \_\_hwloc\_attribute\_unused, hwloc\_cpuset\_t hwlocset, const cpu\_set\_t \*schedset, size\_t schedsetsize)
 

*Convert glibc sched affinity CPU set schedset into hwloc CPU set.*

### 11.22.1 Function Documentation

**11.22.1.1 static \_\_hwloc\_inline int hwloc\_cpuset\_from\_glibc\_sched\_affinity ( hwloc\_topology\_t topology \_\_hwloc\_attribute\_unused, hwloc\_cpuset\_t hwlocset, const cpu\_set\_t \* schedset, size\_t schedsetsize ) [static]**

Convert glibc sched affinity CPU set *schedset* into hwloc CPU set.

This function may be used before calling sched\_setaffinity or any other function that takes a cpu\_set\_t as input parameter.

`schedsetsize` should be sizeof(cpu\_set\_t) unless `schedset` was dynamically allocated with CPU\_ALLOC

```
11.22.1.2 static __hwloc_inline int hwloc_cpuset_to_glibc_sched_affinity
( hwloc_topology_t topology __hwloc_attribute_unused,
  hwloc_const_cpuset_t hwlocset, cpu_set_t * schedset, size_t
  schedsetsize ) [static]
```

Convert hwloc CPU set to poset into glibc sched affinity CPU set `schedset`.

This function may be used before calling sched\_setaffinity or any other function that takes a cpu\_set\_t as input parameter.

`schedsetsize` should be sizeof(cpu\_set\_t) unless `schedset` was dynamically allocated with CPU\_ALLOC

## 11.23 Linux-only helpers

### Functions

- HWLOC\_DECLARESPEC int `hwloc_linux_parse_cpumap_file` (FILE \*file, `hwloc_cpuset_t` set)  
*Convert a linux kernel cpumap file file into hwloc CPU set.*
- HWLOC\_DECLARESPEC int `hwloc_linux_set_tid_cpubind` (`hwloc_topology_t` topology, pid\_t tid, `hwloc_const_cpuset_t` set)  
*Bind a thread tid on cpus given in cpuset set.*
- HWLOC\_DECLARESPEC int `hwloc_linux_get_tid_cpubind` (`hwloc_topology_t` topology, pid\_t tid, `hwloc_cpuset_t` set)  
*Get the current binding of thread tid.*

### 11.23.1 Detailed Description

This includes helpers for manipulating linux kernel cpumap files, and hwloc equivalents of the Linux sched\_setaffinity and sched\_getaffinity system calls.

### 11.23.2 Function Documentation

**11.23.2.1 HWLOC\_DECLARESPEC int hwloc\_linux\_get\_tid\_cpubind ( hwloc\_topology\_t topology, pid\_t tid, hwloc\_cpuset\_t set )**

Get the current binding of thread `tid`.

The behavior is exactly the same as the Linux `sched_setaffinity` system call, but uses a `hwloc_cpuset`.

**11.23.2.2 HWLOC\_DECLARESPEC int hwloc\_linux\_parse\_cpumap\_file ( FILE \* file, hwloc\_cpuset\_t set )**

Convert a linux kernel cpumap file `file` into `hwloc` CPU set.

Might be used when reading CPU set from sysfs attributes such as `topology` and `caches` for processors, or `local_cpus` for devices.

**11.23.2.3 HWLOC\_DECLARESPEC int hwloc\_linux\_set\_tid\_cpubind ( hwloc\_topology\_t topology, pid\_t tid, hwloc\_const\_cpuset\_t set )**

Bind a thread `tid` on cpus given in `cpuset` `set`.

The behavior is exactly the same as the Linux `sched_setaffinity` system call, but uses a `hwloc_cpuset`.

## 11.24 Helpers for manipulating Linux libnuma unsigned long masks

### Functions

- static \_\_hwloc\_inline int `hwloc_cpuset_to_linux_libnuma_ulsongs` (`hwloc_topology_t` `topology`, `hwloc_const_cpuset_t` `cpuset`, `unsigned long *mask`, `unsigned long *maxnode`)

*Convert hwloc CPU set cpuset into the array of unsigned long mask.*

- static \_\_hwloc\_inline int `hwloc_cpuset_from_linux_libnuma_ulsongs` (`hwloc_topology_t` `topology`, `hwloc_cpuset_t` `cpuset`, `const unsigned long *mask`, `unsigned long maxnode`)

*Convert the array of unsigned long mask into hwloc CPU set.*

### 11.24.1 Function Documentation

**11.24.1.1 static \_\_hwloc\_inline int hwloc\_cpuset\_from\_linux\_libnuma\_ulsongs ( hwloc\_topology\_t topology, hwloc\_cpuset\_t cpuset, const unsigned long \* mask, unsigned long maxnode ) [static]**

Convert the array of unsigned long mask into hwloc CPU set.

mask is a array of unsigned long that will be read. maxnode contains the maximal node number that may be read in mask.

This function may be used after calling get\_mempolicy or any other function that takes an array of unsigned long as output parameter (and possibly a maximal node number as input parameter).

**11.24.1.2 static \_\_hwloc\_inline int hwloc\_cpuset\_to\_linux\_libnuma\_ulsongs ( hwloc\_topology\_t topology, hwloc\_const\_cpuset\_t cpuset, unsigned long \* mask, unsigned long \* maxnode ) [static]**

Convert hwloc CPU set cpuset into the array of unsigned long mask.

mask is the array of unsigned long that will be filled. maxnode contains the maximal node number that may be stored in mask. maxnode will be set to the maximal node number that was found, plus one.

This function may be used before calling set\_mempolicy, mbind, migrate\_pages or any other function that takes an array of unsigned long and a maximal node number as input parameter.

## 11.25 Helpers for manipulating Linux libnuma bitmask

### Functions

- static \_\_hwloc\_inline struct bitmask \*\_\_hwloc\_attribute\_malloc **hwloc\_cpuset\_to\_linux\_libnuma\_bitmask** (hwloc\_topology\_t topology, hwloc\_const\_cpuset\_t cpuset)

*Convert hwloc CPU set cpuset into the returned libnuma bitmask.*

- static \_\_hwloc\_inline int **hwloc\_cpuset\_from\_linux\_libnuma\_bitmask** (hwloc\_topology\_t topology, hwloc\_cpuset\_t cpuset, const struct bitmask \*bitmask)

*Convert libnuma bitmask bitmask into hwloc CPU set cpuset.*

### 11.25.1 Function Documentation

**11.25.1.1 static \_\_hwloc\_inline int hwloc\_cpuset\_from\_linux\_libnuma\_bitmask ( hwloc\_topology\_t topology, hwloc\_cpuset\_t cpuset, const struct bitmask \* bitmask ) [static]**

Convert libnuma bitmask `bitmask` into hwloc CPU set `cpuset`.

This function may be used after calling many numa\_ functions that use a struct bitmask as an output parameter.

**11.25.1.2 static \_\_hwloc\_inline struct bitmask\* \_\_hwloc\_attribute\_malloc hwloc\_cpuset\_to\_linux\_libnuma\_bitmask ( hwloc\_topology\_t topology, hwloc\_const\_cpuset\_t cpuset ) [static, read]**

Convert hwloc CPU set `cpuset` into the returned libnuma bitmask.

The returned bitmask should later be freed with `numa_bitmask_free`.

This function may be used before calling many numa\_ functions that use a struct bitmask as an input parameter.

#### Returns

newly allocated struct bitmask.

## 11.26 Helpers for manipulating Linux libnuma nodemask\_t

### Functions

- static \_\_hwloc\_inline int [hwloc\\_cpuset\\_to\\_linux\\_libnuma\\_nodemask](#) (hwloc\_topology\_t topology, hwloc\_const\_cpuset\_t cpuset, nodemask\_t \*nodemask)

*Convert hwloc CPU set cpuset into libnuma nodemask nodemask.*

- static \_\_hwloc\_inline int [hwloc\\_cpuset\\_from\\_linux\\_libnuma\\_nodemask](#) (hwloc\_topology\_t topology, hwloc\_cpuset\_t cpuset, const nodemask\_t \*nodemask)

*Convert libnuma nodemask nodemask into hwloc CPU set cpuset.*

### 11.26.1 Function Documentation

**11.26.1.1 static \_\_hwloc\_inline int hwloc\_cpuset\_from\_linux\_libnuma\_nodemask ( hwloc\_topology\_t topology, hwloc\_cpuset\_t cpuset, const nodemask\_t \* nodemask ) [static]**

Convert libnuma nodemask nodemask into hwloc CPU set cpuset.

This function may be used before calling some old libnuma functions that use a nodemask\_t as an output parameter.

**11.26.1.2 static \_\_hwloc\_inline int hwloc\_cpuset\_to\_linux\_libnuma\_nodemask ( hwloc\_topology\_t topology, hwloc\_const\_cpuset\_t cpuset, nodemask\_t \* nodemask ) [static]**

Convert hwloc CPU set cpuset into libnuma nodemask nodemask.

This function may be used before calling some old libnuma functions that use a nodemask\_t as an input parameter.

## 11.27 OpenFabrics-Specific Functions

### Functions

- static \_\_hwloc\_inline int [hwloc\\_ibv\\_get\\_device\\_cpuset](#) (hwloc\_topology\_t topology \_\_hwloc\_attribute\_unused, struct ibv\_device \*ibdev, hwloc\_cpuset\_t set)

*Get the CPU set of logical processors that are physically close to device ibdev.*

### 11.27.1 Function Documentation

**11.27.1.1 static \_\_hwloc\_inline int hwloc\_ibv\_get\_device\_cpuset ( hwloc\_topology\_t topology \_\_hwloc\_attribute\_unused, struct ibv\_device \* ibdev, hwloc\_cpuset\_t set ) [static]**

Get the CPU set of logical processors that are physically close to device ibdev.

For the given OpenFabrics device ibdev, read the corresponding kernel-provided cpumap file and return the corresponding CPU set. This function is currently only implemented in a meaningful way for Linux; other systems will simply get a full cpuset.

## Chapter 12

# Data Structure Documentation

### 12.1 hwloc\_obj\_attr\_u::hwloc\_cache\_attr\_s Struct Reference

Cache-specific Object Attributes.

```
#include <hwloc.h>
```

#### Data Fields

- `uint64_t size`  
*Size of cache in bytes.*
- `unsigned depth`  
*Depth of cache.*

#### 12.1.1 Detailed Description

Cache-specific Object Attributes.

#### 12.1.2 Field Documentation

##### 12.1.2.1 `unsigned hwloc_obj_attr_u::hwloc_cache_attr_s::depth`

Depth of cache.

### 12.1.2.2 uint64\_t hwloc\_obj\_attr\_u::hwloc\_cache\_attr\_s::size

Size of cache in bytes.

The documentation for this struct was generated from the following file:

- hwloc.h

## 12.2 hwloc\_obj\_attr\_u::hwloc\_group\_attr\_s Struct Reference

Group-specific Object Attributes.

```
#include <hwloc.h>
```

### Data Fields

- unsigned **depth**  
*Depth of group object.*

### 12.2.1 Detailed Description

Group-specific Object Attributes.

### 12.2.2 Field Documentation

#### 12.2.2.1 unsigned hwloc\_obj\_attr\_u::hwloc\_group\_attr\_s::depth

Depth of group object.

The documentation for this struct was generated from the following file:

- hwloc.h

## 12.3 hwloc\_obj\_attr\_u::hwloc\_machine\_attr\_s Struct Reference

Machine-specific Object Attributes.

```
#include <hwloc.h>
```

## Data Fields

- char \* [dmi\\_board\\_vendor](#)

*DMI board vendor name.*

- char \* [dmi\\_board\\_name](#)

*DMI board model name.*

### 12.3.1 Detailed Description

Machine-specific Object Attributes.

### 12.3.2 Field Documentation

#### 12.3.2.1 `char* hwloc_obj_attr_u::hwloc_machine_attr_s::dmi_board_name`

DMI board model name.

#### 12.3.2.2 `char* hwloc_obj_attr_u::hwloc_machine_attr_s::dmi_board_vendor`

DMI board vendor name.

The documentation for this struct was generated from the following file:

- `hwloc.h`

## 12.4 hwloc\_obj Struct Reference

Structure of a topology object.

```
#include <hwloc.h>
```

## Data Fields

- [hwloc\\_obj\\_type\\_t type](#)

*Type of object.*

- unsigned [os\\_index](#)

*OS-provided physical index number.*

- `char * name`  
*Object description if any.*
- `struct hwloc_obj_memory_s memory`  
*Memory attributes.*
- `union hwloc_obj_attr_u * attr`  
*Object type-specific Attributes.*
- `unsigned depth`  
*Vertical index in the hierarchy.*
- `unsigned logical_index`  
*Horizontal index in the whole list of similar objects, could be a "cousin\_rank" since it's the rank within the "cousin" list below.*
- `signed os_level`  
*OS-provided physical level, -1 if unknown or meaningless.*
- `struct hwloc_obj * next_cousin`  
*Next object of same type.*
- `struct hwloc_obj * prev_cousin`  
*Previous object of same type.*
- `struct hwloc_obj * parent`  
*Parent, NULL if root (system object).*
- `unsigned sibling_rank`  
*Index in parent's `children[]` array.*
- `struct hwloc_obj * next_sibling`  
*Next object below the same parent.*
- `struct hwloc_obj * prev_sibling`  
*Previous object below the same parent.*
- `unsigned arity`  
*Number of children.*
- `struct hwloc_obj ** children`  
*Children, `children[0 .. arity -1]`.*

- struct [hwloc\\_obj](#) \* `first_child`  
*First child.*
- struct [hwloc\\_obj](#) \* `last_child`  
*Last child.*
- void \* `userdata`  
*Application-given private data pointer, initialized to NULL, use it as you wish.*
- [hwloc\\_cpuset\\_t](#) `cpuset`  
*CPUs covered by this object.*
- [hwloc\\_cpuset\\_t](#) `complete_cpuset`  
*The complete CPU set of logical processors of this object.,*
- [hwloc\\_cpuset\\_t](#) `online_cpuset`  
*The CPU set of online logical processors.*
- [hwloc\\_cpuset\\_t](#) `allowed_cpuset`  
*The CPU set of allowed logical processors.*
- [hwloc\\_cpuset\\_t](#) `nodeset`  
*NUMA nodes covered by this object or containing this object.*
- [hwloc\\_cpuset\\_t](#) `complete_nodeset`  
*The complete NUMA node set of this object.,*
- [hwloc\\_cpuset\\_t](#) `allowed_nodeset`  
*The set of allowed NUMA memory nodes.*

### 12.4.1 Detailed Description

Structure of a topology object. Applications mustn't modify any field except userdata .

### 12.4.2 Field Documentation

#### 12.4.2.1 [hwloc\\_cpuset\\_t](#) `hwloc_obj::allowed_cpuset`

The CPU set of allowed logical processors.

This includes the CPUs contained in this object which are allowed for binding, i.e. passing them to the hwloc binding functions should not return permission errors. This

is usually restricted by administration rules. Some of them may however be offline so binding to them may still not be possible, see online\_cpuset.

**Note**

Its value must not be changed, hwloc\_cpuset\_dup must be used instead.

**12.4.2.2 hwloc\_cpuset\_t hwloc\_obj::allowed\_nodeset**

The set of allowed NUMA memory nodes.

This includes the NUMA memory nodes contained in this object which are allowed for memory allocation, i.e. passing them to NUMA node-directed memory allocation should not return permission errors. This is usually restricted by administration rules.

**Note**

Its value must not be changed, hwloc\_cpuset\_dup must be used instead.

**12.4.2.3 unsigned hwloc\_obj::arity**

Number of children.

**12.4.2.4 union hwloc\_obj\_attr\_u\* hwloc\_obj::attr**

Object type-specific Attributes.

**12.4.2.5 struct hwloc\_obj\*\* hwloc\_obj::children**

Children, children[0 .. arity -1].

**12.4.2.6 hwloc\_cpuset\_t hwloc\_obj::complete\_cpuset**

The complete CPU set of logical processors of this object.,

This includes not only the same as the cpuset field, but also the CPUs for which topology information is unknown or incomplete, and the CPUs that are ignored when the HWLOC\_TOPOLOGY\_FLAG\_WHOLE\_SYSTEM flag is not set. Thus no corresponding PU object may be found in the topology, because the precise position is undefined. It is however known that it would be somewhere under this object.

**Note**

Its value must not be changed, hwloc\_cpuset\_dup must be used instead.

**12.4.2.7 hwloc\_cpuset\_t hwloc\_obj::complete\_nodeset**

The complete NUMA node set of this object,.

This includes not only the same as the nodeset field, but also the NUMA nodes for which topology information is unknown or incomplete, and the nodes that are ignored when the HWLOC\_TOPOLOGY\_FLAG\_WHOLE\_SYSTEM flag is not set. Thus no corresponding NODE object may be found in the topology, because the precise position is undefined. It is however known that it would be somewhere under this object.

**Note**

Its value must not be changed, hwloc\_cpuset\_dup must be used instead.

**12.4.2.8 hwloc\_cpuset\_t hwloc\_obj::cpuset**

CPUs covered by this object.

This is the set of CPUs for which there are PU objects in the topology under this object, i.e. which are known to be physically contained in this object and known how (the children path between this object and the PU objects).

If the HWLOC\_TOPOLOGY\_FLAG\_WHOLE\_SYSTEM configuration flag is set, some of these CPUs may be offline, or not allowed for binding, see online\_cpuset and allowed\_cpuset.

**Note**

Its value must not be changed, hwloc\_cpuset\_dup must be used instead.

**12.4.2.9 unsigned hwloc\_obj::depth**

Vertical index in the hierarchy.

**12.4.2.10 struct hwloc\_obj\* hwloc\_obj::first\_child**

First child.

**12.4.2.11 struct hwloc\_obj\* hwloc\_obj::last\_child**

Last child.

**12.4.2.12 unsigned hwloc\_obj::logical\_index**

Horizontal index in the whole list of similar objects, could be a "cousin\_rank" since it's the rank within the "cousin" list below.

**12.4.2.13 struct hwloc\_obj\_memory\_s hwloc\_obj::memory**

Memory attributes.

**12.4.2.14 char\* hwloc\_obj::name**

Object description if any.

**12.4.2.15 struct hwloc\_obj\* hwloc\_obj::next\_cousin**

Next object of same type.

**12.4.2.16 struct hwloc\_obj\* hwloc\_obj::next\_sibling**

Next object below the same parent.

**12.4.2.17 hwloc\_cpuset\_t hwloc\_obj::nodeset**

NUMA nodes covered by this object or containing this object.

This is the set of NUMA nodes for which there are NODE objects in the topology under or above this object, i.e. which are known to be physically contained in this object or containing it and known how (the children path between this object and the NODE objects).

If the HWLOC\_TOPOLOGY\_FLAG\_WHOLE\_SYSTEM configuration flag is set, some of these nodes may not be allowed for allocation, see allowed\_nodeset.

**Note**

Its value must not be changed, hwloc\_cpuset\_dup must be used instead.

**12.4.2.18 hwloc\_cpuset\_t hwloc\_obj::online\_cpuset**

The CPU set of online logical processors.

This includes the CPUs contained in this object that are online, i.e. draw power and can execute threads. It may however not be allowed to bind to them due to administration rules, see allowed\_cpuset.

**Note**

Its value must not be changed, hwloc\_cpuset\_dup must be used instead.

**12.4.2.19 unsigned hwloc\_obj::os\_index**

OS-provided physical index number.

**12.4.2.20 signed hwloc\_obj::os\_level**

OS-provided physical level, -1 if unknown or meaningless.

**12.4.2.21 struct hwloc\_obj\* hwloc\_obj::parent**

Parent, NULL if root (system object).

**12.4.2.22 struct hwloc\_obj\* hwloc\_obj::prev\_cousin**

Previous object of same type.

**12.4.2.23 struct hwloc\_obj\* hwloc\_obj::prev\_sibling**

Previous object below the same parent.

**12.4.2.24 unsigned hwloc\_obj::sibling\_rank**

Index in parent's `children[]` array.

**12.4.2.25 hwloc\_obj\_type\_t hwloc\_obj::type**

Type of object.

**12.4.2.26 void\* hwloc\_obj::userdata**

Application-given private data pointer, initialized to NULL, use it as you wish.

The documentation for this struct was generated from the following file:

- hwloc.h

## 12.5 hwloc\_obj\_attr\_u Union Reference

Object type-specific Attributes.

```
#include <hwloc.h>
```

### Data Structures

- struct [hwloc\\_cache\\_attr\\_s](#)  
*Cache-specific Object Attributes.*
- struct [hwloc\\_group\\_attr\\_s](#)  
*Group-specific Object Attributes.*
- struct [hwloc\\_machine\\_attr\\_s](#)  
*Machine-specific Object Attributes.*

### Data Fields

- struct [hwloc\\_obj\\_attr\\_u::hwloc\\_cache\\_attr\\_s cache](#)  
*Cache-specific Object Attributes.*
- struct [hwloc\\_obj\\_attr\\_u::hwloc\\_machine\\_attr\\_s machine](#)  
*Machine-specific Object Attributes.*
- struct [hwloc\\_obj\\_attr\\_u::hwloc\\_group\\_attr\\_s group](#)  
*Group-specific Object Attributes.*

### 12.5.1 Detailed Description

Object type-specific Attributes.

### 12.5.2 Field Documentation

#### 12.5.2.1 struct hwloc\_obj\_attr\_u::hwloc\_cache\_attr\_s hwloc\_obj\_attr\_u::cache

Cache-specific Object Attributes.

## 12.6 hwloc\_obj\_memory\_s::hwloc\_obj\_memory\_page\_type\_s Struct Reference

### 12.5.2.2 struct hwloc\_obj\_attr\_u::hwloc\_group\_attr\_s hwloc\_obj\_attr\_u::group

Group-specific Object Attributes.

### 12.5.2.3 struct hwloc\_obj\_attr\_u::hwloc\_machine\_attr\_s hwloc\_obj\_attr\_u::machine

Machine-specific Object Attributes.

The documentation for this union was generated from the following file:

- hwloc.h

## 12.6 hwloc\_obj\_memory\_s::hwloc\_obj\_memory\_page\_type\_s Struct Reference

Array of local memory page types, NULL if no local memory and page\_types is 0.

```
#include <hwloc.h>
```

### Data Fields

- uint64\_t **size**  
*Size of pages.*
- uint64\_t **count**  
*Number of pages of this size.*

### 12.6.1 Detailed Description

Array of local memory page types, NULL if no local memory and page\_types is 0. The array is sorted by increasing size fields. It contains page\_types\_len slots.

### 12.6.2 Field Documentation

#### 12.6.2.1 uint64\_t hwloc\_obj\_memory\_s::hwloc\_obj\_memory\_page\_type\_s::count

Number of pages of this size.

### 12.6.2.2 `uint64_t hwloc_obj_memory_s::hwloc_obj_memory_page_type_s::size`

Size of pages.

The documentation for this struct was generated from the following file:

- hwloc.h

## 12.7 `hwloc_obj_memory_s` Struct Reference

Object memory.

```
#include <hwloc.h>
```

### Data Structures

- struct `hwloc_obj_memory_page_type_s`

*Array of local memory page types, NULL if no local memory and page\_types is 0.*

### Data Fields

- `uint64_t total_memory`

*Total memory (in bytes) in this object and its children.*

- `uint64_t local_memory`

*Local memory (in bytes).*

- `unsigned page_types_len`

*Size of array page\_types.*

- struct `hwloc_obj_memory_s::hwloc_obj_memory_page_type_s * page_types`

*Array of local memory page types, NULL if no local memory and page\_types is 0.*

### 12.7.1 Detailed Description

Object memory.

## 12.7.2 Field Documentation

### 12.7.2.1 uint64\_t hwloc\_obj\_memory\_s::local\_memory

Local memory (in bytes).

### 12.7.2.2 struct hwloc\_obj\_memory\_s::hwloc\_obj\_memory\_page\_type\_s \* hwloc\_obj\_memory\_s::page\_types

Array of local memory page types, NULL if no local memory and page\_types is 0. The array is sorted by increasing size fields. It contains page\_types\_len slots.

### 12.7.2.3 unsigned hwloc\_obj\_memory\_s::page\_types\_len

Size of array page\_types.

### 12.7.2.4 uint64\_t hwloc\_obj\_memory\_s::total\_memory

Total memory (in bytes) in this object and its children.

The documentation for this struct was generated from the following file:

- hwloc.h

## 12.8 hwloc\_topology\_cpubind\_support Struct Reference

Flags describing actual binding support for this topology.

```
#include <hwloc.h>
```

### Data Fields

- unsigned char [set\\_thisproc\\_cpubind](#)
- unsigned char [get\\_thisproc\\_cpubind](#)
- unsigned char [set\\_proc\\_cpubind](#)
- unsigned char [get\\_proc\\_cpubind](#)
- unsigned char [set\\_thisthread\\_cpubind](#)
- unsigned char [get\\_thisthread\\_cpubind](#)
- unsigned char [set\\_thread\\_cpubind](#)
- unsigned char [get\\_thread\\_cpubind](#)

### 12.8.1 Detailed Description

Flags describing actual binding support for this topology.

### 12.8.2 Field Documentation

#### 12.8.2.1 `unsigned char hwloc_topology_cpusbind_support::get_proc_cpusbind`

Getting the binding of a whole given process is supported.

#### 12.8.2.2 `unsigned char hwloc_topology_cpusbind_support::get_thisproc_cpusbind`

Getting the binding of the whole current process is supported.

#### 12.8.2.3 `unsigned char hwloc_topology_cpusbind_support::get_thisthread_cpusbind`

Getting the binding of the current thread only is supported.

#### 12.8.2.4 `unsigned char hwloc_topology_cpusbind_support::get_thread_cpusbind`

Getting the binding of a given thread only is supported.

#### 12.8.2.5 `unsigned char hwloc_topology_cpusbind_support::set_proc_cpusbind`

Binding a whole given process is supported.

#### 12.8.2.6 `unsigned char hwloc_topology_cpusbind_support::set_thisproc_cpusbind`

Binding the whole current process is supported.

#### 12.8.2.7 `unsigned char hwloc_topology_cpusbind_support::set_thisthread_cpusbind`

Binding the current thread only is supported.

### 12.8.2.8 unsigned char hwloc\_topology\_cpubind\_support::set\_thread\_cpubind

Binding a given thread only is supported.

The documentation for this struct was generated from the following file:

- hwloc.h

## 12.9 hwloc\_topology\_discovery\_support Struct Reference

Flags describing actual discovery support for this topology.

```
#include <hwloc.h>
```

### Data Fields

- unsigned char **pu**  
*Detecting the number of PU objects is supported.*

### 12.9.1 Detailed Description

Flags describing actual discovery support for this topology.

### 12.9.2 Field Documentation

#### 12.9.2.1 unsigned char hwloc\_topology\_discovery\_support::pu

Detecting the number of PU objects is supported.

The documentation for this struct was generated from the following file:

- hwloc.h

## 12.10 hwloc\_topology\_support Struct Reference

Set of flags describing actual support for this topology.

```
#include <hwloc.h>
```

## Data Fields

- struct hwloc\_topology\_discovery\_support \* discovery
- struct hwloc\_topology\_cpubind\_support \* cpubind

### 12.10.1 Detailed Description

Set of flags describing actual support for this topology. This is retrieved with [hwloc\\_topology\\_get\\_support\(\)](#) and will be valid until the topology object is destroyed. Note: the values are correct only after discovery.

### 12.10.2 Field Documentation

**12.10.2.1 struct hwloc\_topology\_cpubind\_support\***  
**hwloc\_topology\_support::cpubind**

**12.10.2.2 struct hwloc\_topology\_discovery\_support\***  
**hwloc\_topology\_support::discovery**

The documentation for this struct was generated from the following file:

- hwloc.h
